without feeling overly edited, and there's plenty of detail in the shadows.

In this sunset picture, you can see how well it handled the sun and the exposure. The bigger main sensor also makes a difference at night. In low light, photos come cleaner, brighter and more detailed, even in situations where many other phones in this price range start showing noise or losing detail.

The ultrawide camera is another strong point, however, it is the same as last year. It's one of the better ultrawide cameras you'll find at this price, and colour consistency stays with the main camera. So if you switch between the two lenses while shooting, you will not notice much of a difference.

The telephoto camera is the same as last year, a 10.8MP sensor with 5x dedicated zoom. This 5x optical zoom gives the Pixel 11 a real advantage over phones like the iPhone 17, which doesn't have any telephoto lens.

Images from the telephoto lens come out sharp and good-looking, with a natural-looking bokeh effect. Most images come out social-media-ready. The edge detection is also great, skin tones lean towards a softer look and it adds a very slight reddish tint to the face.

Video recording goes up to 4K at 60fps on both the main and selfie cameras. The output from both the lenses

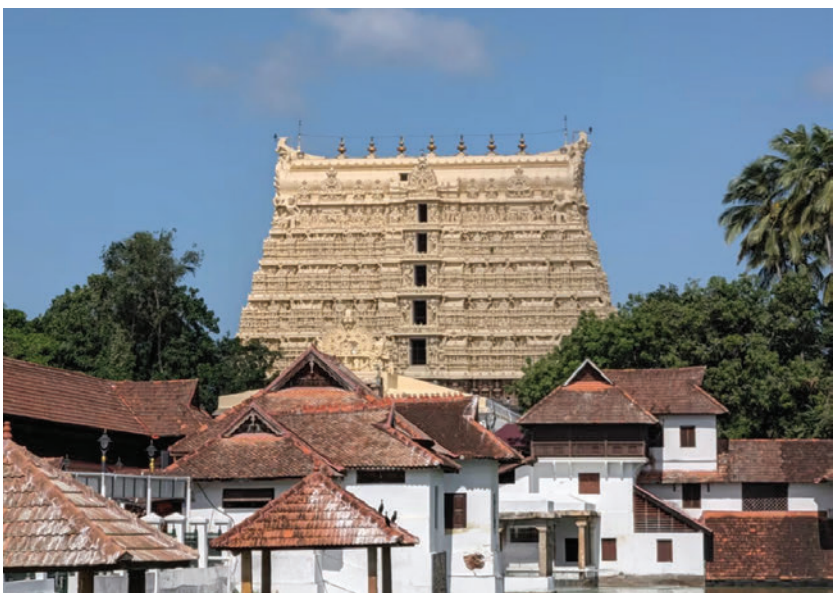

is great, and videos come out stabilised. While recording, you can zoom up to 20x, unlike 30x while taking stills.

Camera Looks is the new feature they added this year. You get three default looks: Natural, Vanilla and Shadows, along with six more creative styles, including Digi, Black Tie, Minimal, Editorial, Classic, and Velvet. Each Camera Look is fully customisable.

The feature I used the most was Magic Capture. Instead of forcing you to choose between taking a photo or recording a video, you can simply hold the shutter button and do both. It records the video while automatically pulling out the best still frames.

Creator Suite is also one of the useful features for those who make content regularly. It automatically organises your clips into a dedicated folder. It also includes a built-in teleprompter for talking to the camera, and it even has speech enhancement to reduce background noise in your recordings.

VERDICT

The Pixel 11 is less about a hardware upgrade and more about refining Google's idea of what a modern smartphone should be. The familiar design makes it comfortable to use, while the main camera remains the biggest strength.

At Rs 89,999, the Pixel 11 isn't trying to win the spec race. It offers a strong camera, excellent display, compact design, long-term software support and an AI-focused experience. Whether that combination justifies the price depends on your requirements and if you prefer Google's software and AI features over raw performance and faster charging.

– Siddharth Malhotra

SPECIFICATIONS

Processor: Google Tensor G6 | Memory: 12 GB | Storage: 256/512 GB | Display: 6.3-inch Actua Display | Refresh rate: 120 Hz | Brightness: 2000 nits | Camera (Rear): 48MP + 13MP + 10.8MP | Camera(Front): 10.5MP | Battery: 4,985 mAh | Charging: 30W Wired, 25W Wireless
