OpenAI vs Google DeepMind: AI drug discovery race

Google DeepMind and OpenAI are pursuing different methods of AI drug development. DeepMind's spinoff, Isomorphic Labs, focuses on designing drugs using protein structure prediction tech. Google has partnerships with Eli Lilly and Novartis and claims its IsoDDE system outperforms AlphaFold 3 in biomolecular prediction.

OpenAI, meanwhile, is targeting drug development workflows using its acquisition of Orchestra Bio. Its GPT-Rosalind model analyses biological and chemical data, while its tools assist with research planning and experiments.

Both companies' approaches could complement each other, but they face challenges proving their real-world impact. Isomorphic must demonstrate that they produce safe, effective treatments, while OpenAI must prove its workflow tools deliver measurable improvements.

NVIDIA Nemotron 3.5 Super VL: Frontier level accuracy at one fifth the size

For years, the AI industry has followed one rule: bigger is better. More parameters, more GPUs and higher costs. NVIDIA is challenging that thinking with Nemotron 3.5 Super VL, a 120-billion-parameter model that claims to match its largest reasoning model on multimodal agentic tasks using roughly one-fifth the parameters. It also claims five times the throughput of comparable open-source models. But what does NVIDIA mean by frontier performance, and why should everyday users care?

Perplexity's AI Computer can now perform tasks without internet on Macs

Perplexity has introduced fully local Computer AI for supported Macs, allowing users to manage files, emails, and documents without sending data to the cloud. Powered by Qwen 3.6 or PPLX Pro, it can automate workflows while keeping data on-device. Available to Pro, Max and Enterprise subscribers, the feature also offers Hybrid Compute for cloud-based reasoning.
