Gigabyte RTX 5060 Windforce MAX OC 8GB GDDR7

The Gigabyte RTX 5060 Windforce MAX OC carries 8GB of GDDR7 memory on Nvidia's Blackwell architecture, with a factory overclock for a little extra speed. It costs only around ₹5,000 more than the RTX 5050, and that gap is money well spent. The 5060 brings more cores and faster

GDDR7 memory, plus the full DLSS 4 toolkit with multi frame generation, which stretches frame rates in supported games. It pairs well with the Core Ultra 5 and Ryzen 5 builds. Use it for 1080p gaming at high settings, esports titles at high refresh rates and entry-level video editing. Anyone aiming higher than 1080p should look further up the stack.

ASRock AMD Radeon RX 9070 GRE Steel Legend Dark 12GB

ASRock's RX 9070 GRE Steel Legend Dark is a 1440p card with 12GB of GDDR6 memory, built on AMD's RDNA 4 architecture and wrapped in the Steel Legend's dark colour scheme. The RX 9060 XT comes with 16GB for a similar price, but the 9070 GRE is a much faster GPU, and the 4GB difference is an easy trade. Raw performance matters more than a

bigger memory pool at the resolutions this card targets. FSR 4 support helps in demanding games. Use it for 1440p gaming at high settings, light 4K play with upscaling and GPU-accelerated editing.

ASRock AMD Radeon RX 9050 Challenger 8GB

The ASRock RX 9050 Challenger is an entry-level RDNA 4 card with 16 compute units and 8GB of GDDR6 memory on a 128-bit bus. In this market, an RTX 3050 can cost about the same, yet the 6GB model gives you less. The RX 9050 offers better performance and 2GB of extra VRAM, along with newer RDNA 4 features such as FSR 4 upscaling and modern display outputs. That makes it an easy pick for a first build. Use it for 1080p esports gaming, older and mid-weight titles at medium settings, and everyday work like office tasks and video playback. Keep expectations in check for the latest heavy games.

Zotac Gaming GeForce RTX 5070 Ti AMP Extreme INFINITY 16GB GDDR7

The Zotac RTX 5070 Ti AMP Extreme Infinity is a high-end card with 16GB of GDDR7 memory on a 256-bit bus, wrapped in a factory-overclocked, premium cooler design. This is the card for 4K gaming at high settings, ray tracing and DLSS 4 multi frame generation. You can go for it today only if you are willing to splurge well over a lakh, and the price reflects the premium partner design. Creators benefit too, since the 16GB buffer and strong CUDA performance speed up 3D rendering, video exports and

AI workloads. Pair it with the Core Ultra 9 or Ryzen 9 builds so the processor never holds it back.

Asus Dual GeForce RTX 5060 Ti 16GB GDDR7

The Asus Dual RTX 5060 Ti 16GB is the middle ground in this lineup. It pairs 16GB of GDDR7 memory with Blackwell cores, so it handles modern games that choke 8GB cards. It delivers strong performance without crossing the one lakh barrier, which suits anyone who wants more than an RTX 5060 but cannot stretch to an RTX 5070. The card is a solid 1440p performer, supports DLSS 4 with multi frame generation and handles light 4K gaming with upscaling. Use it for high-refresh 1440p gaming, video editing and entry-level AI or 3D work where VRAM matters. Pair it with a Ryzen 7 or Core Ultra 5 class processor.
