RAM + SSD

EVM 8GB DDR5 5600MHz + EVM 512GB NVMe SSD

EVM is the budget-friendly pick here, and this 8GB DDR5 5600MHz kit with a 512GB NVMe SSD is probably the

cheapest pairing you can find in the current market, at around ₹20,000. It makes sense for lower-performance builds like an RX 9050 rig where cost matters most. The catch is capacity. 8GB of RAM is tight for modern multitasking, and 512GB fills up fast. Keep the SSD for Windows, your launcher and the files that matter, then add an HDD for bulk storage later. Use it for office work, browsing, esports titles and a first gaming rig that you plan to upgrade.

Corsair Vengeance 32GB (4x8GB) DDR5 5200MHz CL40 + Crucial P310 1TB Gen4 NVMe

Corsair's Vengeance 32GB kit runs four 8GB sticks at 5200MHz CL40. 8GB sticks at 6000MHz are not widely available, so this is one of the better options on the shelf. The Crucial P310 1TB brings fast Gen 4 storage with a heatsink included, and it outperforms the E100 at the same price. Together they give a gaming build plenty of headroom for 1440p titles, streaming and multitasking. All four slots are filled, so a later RAM upgrade means replacing sticks, and it needs a four-slot board rather than a mini-ITX one. Use it for gaming, budget content creation and a machine that keeps a big game library installed.

TeamGroup T-Create Expert 32GB (2x16GB) 6000MHz DDR5 CL38 + WD Black SN7100 1TB Gen 4 NVMe

This is the high-cost, high-performance pairing, and it comes with no regrets. TeamGroup's T-Create Expert is a 32GB kit of two 16GB sticks running at 6000MHz with CL38 timings, and 6000MHz is the sweet spot for AM5 builds. The WD Black SN7100 1TB is a Gen 4 NVMe drive with read speeds up to 7,250MB/s, so game loads and large file transfers feel quick. Because the kit uses two sticks, you keep two slots free for upgrades on a four-slot board. It suits serious gaming, 4K video editing, streaming and heavy multitasking. Pair it with the Core Ultra 9 or a high-end Radeon or GeForce card.

G.Skill Ripjaws S5 32GB (2x16GB) DDR5 6000MHz + Samsung 990 PRO 1TB Gen 4 NVMe

G.Skill's Ripjaws S5 is a dependable 32GB kit of two 16GB sticks at 6000MHz DDR5, a speed that AM5 and Intel boards both run happily. Samsung's 990 Pro 1TB is a PCIe 4.0 x4 drive with read speeds up to 7,450MB/s, and it ranks among the fastest Gen 4 SSDs you can buy. The pairing works because both parts avoid bottlenecks, so the CPU and GPU get fed without delay. Samsung's reputation for reliability helps too. Use it for high-refresh gaming, game libraries that load fast, photo and

video editing and day-to-day productivity. It slots into mid-range and high-end builds alike.

V-Color Manta XFinity RGB 64GB (2x32GB) DDR5 6000MHz CL30 + Kingston NV3 2TB Gen 4 NVMe

V-Color's Manta XFinity RGB is a 64GB kit of two 32GB sticks at 6000MHz with fast CL30 timings, and the RGB lighting gives an open-case build some flair. That much memory suits workloads that eat RAM, like 4K and 8K video editing, 3D rendering, virtual machines and large datasets. The Kingston NV3 2TB is a Gen 4 x4 drive that gives you plenty of room for projects, raw footage and a big game library. It runs slower than premium drives, but the capacity does the work. Together they suit creators, streamers and power users who juggle many apps at once, and they leave room for gaming.
