POWER SUPPLY

Gigabyte P550SS 550W 80 Plus Silver ATX

The Gigabyte P550SS is a 550W ATX power supply with an 80 Plus Silver rating, and it is the practical choice for budget builds. Silver efficiency keeps wasted energy and heat in check, and 550W is enough for a mainstream processor paired with an RTX 5060 or RX 9050. It makes sense in the lower-priced builds from this feature, where every rupee should go to the CPU and graphics card. Use it for 1080p gaming rigs, student PCs, office machines and first builds. Skip it if you plan to move to a power-hungry GPU later, because 550W leaves little headroom for upgrades.

Cooler Master G800 80 Plus Gold Rated

The Cooler Master G800 is an 800W power supply with an 80 Plus Gold rating, and it hits the sweet spot for mid-range gaming builds. Gold efficiency wastes less energy as heat,

which helps keep the case cooler and quieter. At 800W it covers cards like the RTX 5060 Ti 16GB or the RX 9070 GRE with room to spare, and it leaves space to move up a tier later. It works well with a Ryzen 7 or Core Ultra 7 class chip. Use it for 1440p gaming, streaming and light content creation. It also suits a PC you expect to upgrade over several years.

Corsair HX1200i ATX 3.1 Platinum 1200W Fully Modular

The Corsair HX1200i is the flagship here, a 1200W fully modular unit with an ATX 3.1 design and an 80 Plus Platinum rating. ATX 3.1 brings a native 12V-2x6 connector for modern GPUs, so high-end cards connect without adapters. Platinum efficiency lowers wasted energy, and the fully modular cables keep a big build tidy.

Corsair's i-series also supports software monitoring through iCUE. This unit is built for the Core Ultra 9 285K or a Ryzen 9 chip paired with an RTX 5070 Ti or something stronger. Use it for 4K gaming, rendering, heavy multitasking and multi-drive workstations. It is overkill for small builds, so match it to power-hungry hardware.

MSI MPG A650GF 650W 80 Plus Gold

The MSI MPG A650GF is a 650W power supply with an 80 Plus Gold rating, and it is a good fit for mid-range builds that do not need much extra capacity. Gold efficiency keeps heat and noise down, and 650W is enough for a mainstream processor and an RTX 5060 Ti 16GB or RX 9070 GRE class card. It sits between the budget 550W units and the larger

800W models. Use it for 1440p gaming rigs, everyday productivity and streaming. MSI's MPG line targets gamers who want dependable power without paying for flagship extras. Check your graphics card's recommended wattage first though, since 650W can run tight with power-hungry GPUs.

ASUS TUF Gaming 1000W 80 Plus Gold Fully Modular

The ASUS TUF Gaming 1000W is a fully modular power supply with an 80 Plus Gold rating, aimed at high-end gaming builds. The ASUS TUF lineup is known for durable construction, and 1000W gives a card like the RTX 5070 Ti plenty of power with spare capacity for power spikes. Fully modular cables let you route only what the build needs, which keeps airflow clean in a big case. Pair it with a Core Ultra 9 or Ryzen 9 processor. Use it for 4K gaming, rendering, streaming and builds you plan to keep for years. That much capacity also leaves room to move up to a faster GPU later.
