CPU COOLER

Noctua NH-P1 Passive 120mm CPU Air Cooler

The Noctua NH-P1 is a fanless tower cooler made for passively cooled systems and silent home theatre PCs. Its large fin stack and heatpipes pull heat off the CPU and hand it to case airflow, so there is nothing to whirr, rattle or wear out. Pair it with a low-TDP chip like the Ryzen 7 8700G, which sits at 65W, and you get a near-

silent build that still runs cool. Good case ventilation matters, since the cooler depends on it. Use it for living room PCs, home studios, editing suites and office machines. Skip it for overclocked flagship processors like the Core Ultra 9 285K, because passive cooling has limits.

Arctic Liquid Freezer III Pro 360

Arctic's Liquid Freezer III Pro 360 is the value king among 360mm AIO coolers. Its radiator is 38mm thick,

thicker than the usual 27mm design, so it holds more coolant and handles temperature spikes well. Three P12 Pro fans spin up to 3000 RPM, and a small fan on the pump block blows air over the motherboard's VRM area, which helps on hot, power-hungry chips. Pair it with the Core Ultra 9 285K or the Ryzen 9 9950X3D2 and it keeps sustained heavy loads in check. Use it for heavy gaming, rendering, long editing sessions and overclocking. Arctic backs it with a solid six-year warranty.

Thermaltake MagFloe 360 Ultra ARGB Sync

The Thermaltake MagFloe 360 Ultra ARGB Sync is the real showpiece of this lineup. A 3.95-inch square LCD on the pump head shows system stats or custom visuals, and you customise it through the TT PlayLink app. Three 120mm SWAFAN EX fans snap on with magnetic connectors, which cuts cable clutter, and swappable blades let you flip airflow direction without turning the fan around. The 360mm radiator has a 27mm profile with a thickened copper chamber for better cooling. Pair it with the Core Ultra 9 285K in a tempered-glass case for great performance and a PC that looks great and shows the music you are listening to or maybe just a basic basketball animation, upto you. Use it for heavy gaming, streaming and showpiece builds meant to be looked at. Style costs extra.

Cooler Master Hyper 212 Halo ARGB CPU Air Cooler

The Cooler Master Hyper 212 Halo ARGB is the cooler that built the 212 name, updated with a Halo² fan and a black finish. It is a single-tower design with four heatpipes and a compact 154mm height, so it fits most mid-tower cases. The 120mm fan spins between 650 and 2050 RPM, and the dual-loop ARGB lighting adds some flair. With a rating of around 210W, it has headroom for the Ryzen 5 7600X or a similar six-core chip. A second set of clips lets you add another fan later for extra cooling. Use it for 1080p and 1440p gaming rigs, everyday work and first builds.

Corsair Nautilus 240 RS LCD CPU Liquid Cooler

The Corsair Nautilus 240 RS LCD packs a 2.1-inch IPS screen into the pump cap, and it shows CPU temperatures, GIFs or custom images through iCUE so if you want, you can

see how warm your CPU is running. Two RS120 fans with magnetic dome bearings keep noise low, and they daisy-chain to a single motherboard header, which keeps cabling tidy. The 240mm radiator fits more cases than a 360mm unit, so it suits mid-range builds around the Core Ultra 5 250K Plus. It supports Intel LGA 1851 and AMD AM5, matching the platforms in this feature. Use it for gaming rigs, streaming setups and compact builds that still want a screen. Corsair backs it with a five-year warranty.
