PC CASES

Lian Li Lancool 216 ARGB E-ATX Mid Tower

The Lian Li Lancool 216 ARGB is a mid tower built around airflow. Mesh panels cover the front and top, and two 160mm ARGB fans at the front move plenty of air, backed by a 140mm fan at the rear. It takes ATX boards and E-ATX boards up to 280mm wide, fits GPUs up to 392mm and supports a 360mm radiator at the front or top. That makes it a natural home for the Core Ultra 9 285K with the Arctic Liquid Freezer III Pro 360. Use it for high-performance gaming rigs, heavy editing workstations and any build that needs to stay cool.

NZXT H9 Flow ATX Mid Tower

The NZXT H9 Flow is a dual-chamber mid tower that shows off your build without trapping heat. Panoramic tempered glass wraps the front and side, while the PSU and cables stay in a separate chamber, and a perforated top panel helps hot air escape. It has room for ten fans in total and 360mm radiators, and four fans are included. GPUs over 430mm long fit with ease, so the ASRock RX 9070 GRE or the Zotac RTX 5070 Ti slot in without trouble. Use it for showcase gaming builds, streaming setups and anyone who wants clean looks and strong airflow in the same case.

Fractal Design Terra Mini-ITX Cabinet

The Fractal Design Terra is a mini-ITX case that looks more like furniture than a PC. Anodised aluminium and walnut trim wrap a 10.4 litre body, and a sliding internal spine lets you give extra room to either the GPU or

the CPU cooler. It fits graphics cards up to 322mm and includes a PCIe 4.0 riser cable. CPU cooler height tops out at 77mm, so go for efficient chips and low-profile air coolers rather than a 200W flagship. Use it for a desk-side gaming PC, a living room machine or a compact build that doubles as decor. Space is tight, so plan your parts before you buy.

Thermaltake The Tower 600 ATX Mid Tower

Thermaltake's The Tower 600 is an octagonal showpiece with three tempered glass panels that turn your parts into a display. It is an ATX mid tower that also supports hidden-connector motherboards for clean,

cable-free builds. Cooling support is generous, with a 420mm radiator on the right and a 360mm radiator on the left, plus room for up to thirteen 120mm fans. Two 140mm fans at the top handle exhaust. It takes GPUs up to 400mm, and two extra GPU brackets help support heavy cards and riser cables. Use it for high-end showcase builds, such as the Core Ultra 9 285K with the MagFloe 360 and an RTX 5070 Ti.

HYTE Y70 Dual Chamber Mid-Tower ATX Cabinet

The HYTE Y70 is a dual-chamber mid tower with a 3-piece panoramic

glass design that frames the build like a showcase. A 4-slot vertical GPU mount comes with an included PCIe 4.0 riser cable, so even chunky cards sit on display, and a cold floor under the GPU can take three 120mm or two 140mm fans that feed it fresh air. It fits GPUs up to 422mm and 360mm radiators on the side and top, with room for ten fans. Fans are not included, so budget for them. Use it for showpiece gaming builds with the RTX 5070 Ti or RX 9070 GRE and a 360mm AIO.
