is a compliment if you haven't gotten the whiff. The interface is Gemini-like, as that's the brain.

If you are a premium subscriber to this service, you can get personalised plans, summaries, insights, trends, and you can chat with this Google Health Coach as you'd with Gemini or any other chatbot.

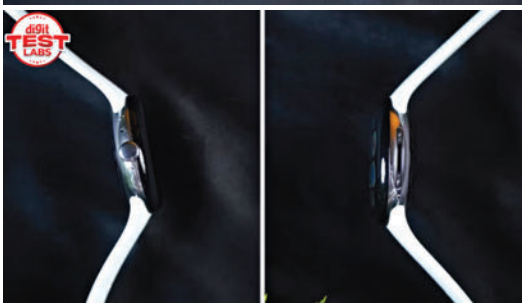

The Health Coach can be helpful, but needs patience. You have to use it for some weeks to build personalised guidance. It can connect to different parts of your routine like activities, sleep, and other health information, and inform you accordingly.

There is also the risk of factual hallucinations that an AI can make. So, don't entirely rely on the estimates the Google Coach gives. Needless to say, I would treat the workout and health tracking data from this, or any other watch, with some caution.

The Pixel Watch 5 supports an exhaustive list of over 50 exercises, like running, walking, cycling, swimming, weightlifting, tennis, HIIT, hiking, elliptical, and rowing. Automatic activity detection works for activities such as walking, running, cycling, sports, elliptical, and rowing, generally after a few minutes of continuous activity.

This Pixel Watch can measure the main health metrics expected from a premium smartwatch, such as heart rate, resting heart rate, HRV, SpO2, breathing rate, skin-temperature variation, ECG, stress/body-response tracking, and sleep. You get Cardio Load, Target Cardio Load, and Daily Readiness, which is helpful in recovery.

Speaking of recovery, the sleep tracking was rich in information and useful in knowing what happens during my slumber. There are, of course, discrepancies, like the wake-up time being mistook for when I checked the watch.

All the results were fairly consistent and detailed, and I was learning more about my body and routines thanks to the watch and coach. Even my wife was logging her periods and symptoms, and it helped her better estimate her cycle.

AMPLE BATTERY LIFE

The 41mm has a 332mAh battery and is rated for up to 30 hours with the Always-On Display. Google also claims up to 48 hours in Battery Saver mode. I got 33 hours 45 minutes, or close to 1 day and 10 hours in one test, and in another test, I got 2 days 6 hours of runtime.

In regular mixed use, the 41mm is easily a one-day watch with a sensible charging habit. I could get through a normal day and sleep tracking, but I still had to think about when to charge it. If you are conservative, you can wear it for 2 days before looking for the charger.

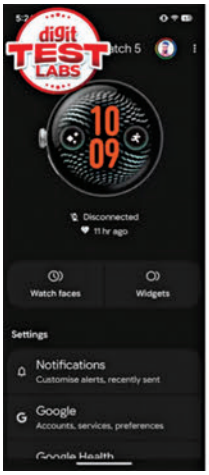

The charging speed is good. Google says the 41mm can reach 50% in around 15 minutes and 100% in about 45 minutes. I didn't time it, but it didn't feel like it was slow.

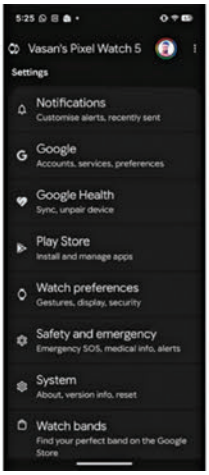

VERDICT

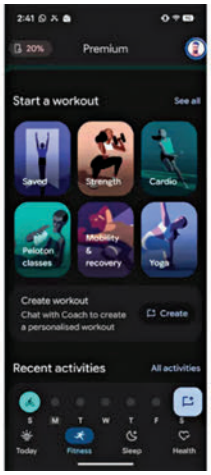

The Pixel Watch 5 is one of those watches where your use more than the specification sheet. At Rs 42,900, I would not buy it to have a smartwatch. For notifications, calls, music controls and the occasional workout, there are cheaper options that can do enough.

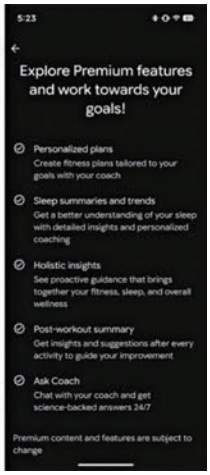

It is as much about Google's health platform as it is about the watch itself. You are paying for the hardware, the tracking capabilities, and the software intelligence built around your data.

– GS Vasan

SPECIFICATIONS

Processor: Qualcomm Snapdragon® W5 Gen 2 Accelerated and Cortex-M55 co-processor | OS: Wear OS 7.0 | Storage: 64GB eMMC Flash | Display: 1.2-inch coloured AMOLED LTPO screen | Refresh rate: 60 Hz | Brightness: 3000 nits | Battery: 332 mAh | Connectivity: 4G LTE and UTMS, Bluetooth 6, Wi-Fi | Dimensions: 41 mm diameter × 12.3 mm height | Weight: 31 g
