Toshiba Z670SP 65-inch Mini LED TV

What does Mini LED bring to this price

₹79,990

Buying a 65-inch TV used to mean spending well into the premium segment, but the category has changed quite a bit. You can now get a large screen with Mini LED backlighting, high refresh rates and gaming-focused features without going too far beyond the Rs 80,000 mark.

The 65-inch model comes with a 4K Mini LED panel and a native 144Hz refresh rate, along with Dolby Vision, Filmmaker Mode, HDMI 2.1, VRR and ALLM. Toshiba has also equipped it with a 54W four-speaker system, while Vidaa brings features such as Apple AirPlay and hands-free voice controls.

We spent time with the 65-inch Z670SP across movies, sports, streaming content and gaming to see where it stands against what you can expect from TVs around this price. At Rs 79,990, does Toshiba's Mini LED approach offer enough to make the Z670SP worth considering?

DESIGN AND BUILD

The Z670SP has a fairly understated design. The bezels are slim enough that most of your attention stays on the picture. The lower section is slightly thicker and houses the Toshiba and Regza branding along with the standby indicator.

Build quality is one area where Toshiba has done a good job. The rear uses a metal construction and the supplied table stands are also metal rather than lightweight plastic. They feel sturdy once attached and have rubber sections underneath to prevent the TV from sliding around easily. Toshiba has also integrated a small cable-management section into the stand, which is a useful touch when the TV is on a table.

One thing worth keeping in mind is that while the table-top stands themselves feel sturdy and provide a good grip, the TV can still feel a little shaky once mounted on them. Even a light touch can make the screen wobble slightly, so you'll need to be a bit careful while dusting or adjusting the TV. The stands are also positioned quite far apart, so if you're planning to table-mount the 65-inch model, make sure your TV unit is wide enough to accommodate them properly. It's not a deal-breaker, but it is something to consider if you don't plan to wall-mount the TV.

PORTS AND CONNECTIVITY

The Z670SP is well equipped for a modern home entertainment setup. There are four HDMI 2.1 ports, USB, Ethernet, optical audio and an antenna connection. The power input is positioned separately on the opposite side, while the main connectivity ports are grouped together.

HDMI 1 and 2 support 4K at 60Hz, while HDMI 3 and 4 are the high-bandwidth ports capable of handling 4K at 144Hz. These are the ones you will want to use for high-refresh-rate gaming. The TV also supports eARC, so a compatible soundbar can be connected without giving up the higher-quality audio formats supported by the TV.

DISPLAY PERFORMANCE

The 4K Mini LED panel is one of the biggest strengths of the Toshiba Z670SP. Mini LED performance depends heavily on how well the backlight and local dimming are implemented, and in our testing, the TV delivered strong contrast, particularly with HDR content.

Our Calman testing measured 617.1 nits of brightness. The panel gets bright enough to make HDR highlights stand out against darker portions of the frame. A 0.1-nit black level also helps the TV produce deep blacks, which was particularly noticeable during the submarine sequence in Mission: Impossible: The Final Reckoning. Dark portions of the frame retained good detail without looking washed out, although some limitations of an LCD panel were still visible in challenging scenes.

In our testing, colour coverage reached 71.09% of BT.2020 and 95.08% in DCI-P3, which means colour accuracy isn't particularly strong. However, I
