wouldn't consider that a major surprise at this price point. In actual viewing, colours look punchy without making regular TV content excessively saturated. We did also notice some visible bending in dark-to-light colour gradients in parts of the image, particularly in the background. It isn't something you'll notice in every scene, but it can show up in certain content with smooth colour transitions.

For lower-resolution content, the Z670SP performs reasonably well. We tested it with a set-top box, and the upscaling keeps the picture clean and detailed enough from a normal viewing distance. MEMC helps with motion as well, particularly when watching sports. Football and cricket benefited from smoother camera movement and better clarity during fast sequences, making the ball easier to follow.

The Z670SP also delivered better-than-expected viewing angles during our testing, with colours and overall clarity holding up well from moderate angles. Dolby Vision content on Netflix also looked impressive, with the combination of brightness and local dimming helping highlights stand out while retaining detail in darker areas.

For movies, Filmmaker Mode takes a more restrained approach by reducing some of the punchier processing and offering a more natural presentation.

GAMING

Gaming is arguably one of the strongest reasons to consider this TV. The panel has a native 144Hz refresh rate and supports VRR and ALLM, while the higher-bandwidth HDMI ports can handle 4K at up to 144Hz.

I connected my PS5 and spent time playing Spiderman 2, Hogwarts Legacy, and Apex Legends. Since the PS5 tops out at 120Hz, you won't actually be using the full 144Hz capability of the panel with Sony's console. Even so, gameplay felt smooth and responsive during testing, with no obvious stuttering or distracting frame drops.

Toshiba also provides a dedicated gaming interface with additional gaming controls and information such as the current frame rate. It is a small addition, but one that makes the TV feel more purpose-built for gaming rather than simply having a high-refresh-rate panel on the specification sheet.

AUDIO PERFORMANCE

The Toshiba Z670SP comes with a 54W four-speaker setup, including front-firing speakers that direct sound towards the viewer rather than downwards. This makes the audio feel more direct, with dialogue coming through clearly and the overall output getting loud enough for a reasonably sized room. The front-firing setup also adds to the viewing experience, especially while watching movies, as the sound feels more closely tied to what's happening on screen.

There is a decent amount of bass as well, giving music, movies and action sequences some weight, although it doesn't have the depth you would get from a dedicated subwoofer. Still, for regular TV shows, sports and movies, the built-in speakers are capable enough and don't immediately make you feel the need for a soundbar.

VERDICT

The Toshiba Z670SP is a strong showcase of what a Mini LED TV can offer in this price segment. Its display delivers the kind of contrast and HDR performance that makes movies more engaging, while the 144Hz refresh rate adds another dimension to sports and gaming. The 54W audio system also complements the large screen well, with the front-firing speakers.

What I liked about the Z670SP is that the experience doesn't stop at the display. Vidaa keeps things simple, AirPlay works smoothly, and the hands-free voice controls are useful additions. With HDMI 2.1, VRR, ALLM, Dolby Vision and Filmmaker Mode, the TV is equally comfortable handling movies, sports and gaming.
