tering character, but the processing does not completely remove natural skin texture. That is important because excessive beautification can quickly make portraits look artificial. Even saturated clothing and fabrics retain folds and texture without losing detail to aggressive exposure or colour processing.

Vivo has also loaded the V80 with plenty of software features for users who like to experiment. The ZEISS Multifocal Portrait mode offers different looks at 23mm, 35mm, 50mm, 85mm and 100mm, with each recreating a different ZEISS-inspired bokeh style. These are not simply different zoom levels; the idea is to give portraits a different visual character depending on the focal length and processing style you choose.

DISPLAY

The Vivo V80 gets a 6.59-inch 1.5K OLED display that is sharp, bright, and noticeably punchy, making everything from scrolling through social media to watching videos look vibrant without feeling overly artificial. The 1260 x 2750 pixel resolution with a 459 ppi is a good middle ground between sharpness and power consumption. Text looks crisp, images have plenty of detail, and you don't really feel like you are missing out by not having a higher-resolution panel.

Another thing to talk about here is the 144Hz refresh rate. In everyday use, this makes animations, scrolling, and transitions feel fluid. It is not something you constantly think about once you get used to it, but switching back to a lower-refresh-rate display does make the difference noticeable.

Brightness is another strong point. Vivo claims a local peak brightness of 5,000 nits, and in our testing, the phone managed to hit around 2,850 nits in High Brightness Mode using a lux meter. That is plenty bright for outdoor use, and using it under bright sunlight.

The panel supports HDR10+ playback and a claimed 1.07 billion colours, which helps compatible content look more vibrant, particularly in scenes with bright highlights and deeper shadows. The colours are generally punchy, which also fits well with the V80's camera tuning. Vivo has clearly prioritised a display that looks impressive rather than one that feels overly restrained.

The flat panel and slim 1.25mm bezels also help with the overall experience. There is plenty of screen real estate without the phone becoming large, and the narrow borders give the front a more immersive appearance.

Vivo also calls this a 'paper-like' display and has included SGS certification for its eye-protection features.

VIVO V80 VERDICT

After spending time with the Vivo V80, its priorities become quite clear. This is a phone designed around the things many users interact with most every day: taking photos, watching content, scrolling, and getting through the day without reaching for a charger. It does those things well, but the higher price also makes its compromises harder to ignore.

The cameras are the strongest part of the experience. The main sensor delivers punchy colours and good dynamic range, while the telephoto adds useful flexibility for portraits and zoom shots. Low-light performance is another highlight, and Vivo's ZEISS modes and AI tools give you plenty of ways to change the look of your photos.

The compromises become more noticeable when you look at where the V80 now sits in the market. The Snapdragon 7 Gen 4 keeps everyday usage smooth, but it does not feel ambitious at this price, especially for demanding games. charging is another compromise.

So, the Vivo V80 is undoubtedly a good phone. It has great cameras, a gorgeous display, an attractive design and excellent battery life. The question is whether buyers are ready for the new prices that phones in this category will command.
