Spec	DJI Osmo 360 II	Insta360 X6
Sensor	1-inch square HDR CMOS (DJI-claimed industry first)	Dual 1/1.1-inch square Sony CMOS (1-inch equivalent combined area)
Max 360 video	8K/60fps, plus native 4K/240fps slow motion	8K/50fps
Single-lens mode	4K/120fps	5K/60 and 4K/120
Dynamic range / HDR	14.5 stops (DJI lab measurement)	First native in-camera Dolby Vision
Colour / log	10-bit, D-Log M	10-bit, I-Log
Aperture	f/1.9	f/2.0
Low-light mode	SuperNight 2.0, up to 60fps	PureVideo, capped at 30fps
Photo resolution	120MP RAW panoramic	120MP
Internal storage	105 GB	64 GB
Battery runtime	100 min	140 min (8K30), 2,600 mAh
Fast charge	80% in 22 min	80% in 24 min
Waterproofing	10 m	IP68, 20 m bare, 60 m with dive case
Price	₹75,000	₹81,999

owning such a camera in the first place, and this is why so much footage never makes its way out of SD cards. Insta360 solves that problem with two methods.

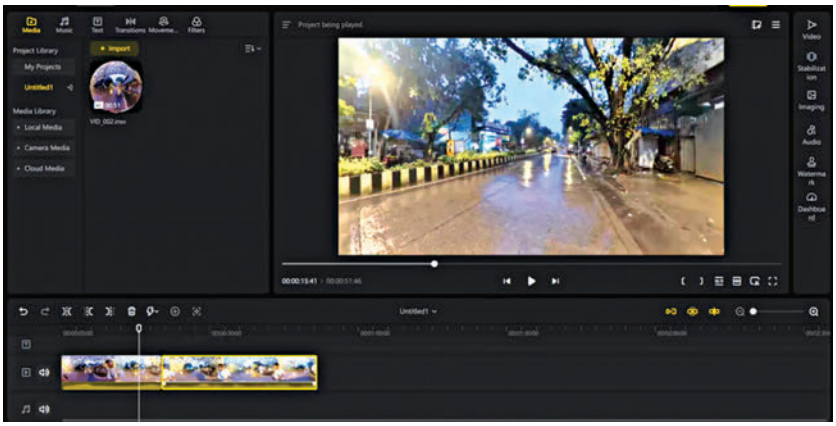

The first is connected to the footage you extract from the X6. In case you haven't exported a video using a fixed aspect ratio, you will get two files – the 360 video itself, and a LRV file. The LRV is the low-resolution video file that can be used as a proxy without causing your editing software to freeze all the time.

Second, once you're in the Insta360 Studio app, reframing happens through what's essentially a virtual camera you steer inside the sphere. With this camera, you are able to move closer or pan, tilt or create keyframes for transition between different viewpoints after the shoot. There are five basic viewing modes, Mega, Ultra, Dewarp, Linear and the Mini planet view, with the ability to zoom within the selected viewpoint.

The AI Director

If there is one thing that makes a difference in how you will be using this camera on a daily basis, it would be the AI Director, and it certainly needs some attention. The manual refocusing of 360 videos takes so much time that it becomes impossible to do, which is why so many 360 videos never to see the light of the day. That is what the AI Director of Insta360 is all about. You need to have your camera on charge at the time when you do it and if you want to do it with footage that you have on your cloud and not the one on your camera, you have the Moments/ Moments Pro available as well.

I tested it using videos from both my trips to Mumbai and Pune. It selected the clips that were worth saving, added pans and reveals that I would not have imagined keyframing myself, and did it all faster than it takes to brew a cup of coffee. The problem, atleast for me, is its pacing. By default, it is very aggressive, full of quick cuts, designed for reels more than for the shot itself. During the Pune trip, when the dam and the hills provided much of the visuals, I wished that it gave each frame a chance to breathe and kept it on screen a bit longer before cutting. It's more of a matter of taste, and if you want reels, this does exactly what it should do.

Audio

This is where I was surprised. You won't have to lug along your own external mic, and while riding a bike or out on trails, you'll only realize how convenient this is. During my bike trip in Pune, the mic recorded the engine of the bike, the noise of the wind, the Kendrick Lamar song playing from my phone, and me singing along. All of it was heard and nothing overpowered anything else.
