pany app. Through it, you can monitor incoming and purified TDS, remaining tank water, daily and weekly consumption, flow rate, and filter health. You can also check warranty information and run a machine health check. Urban Company says the purifier can report performance information in real time and identify potential issues before they turn into a service problem.

You can also change the preset water quantities for the Glass and Bottle modes. That is important as different homes use different glasses and bottles. so having the flexibility to set the exact quantity makes more sense than forcing everyone to use the same preset.

My only issue with this is the Native purifier interface is wrapped inside the larger Urban Company app and some people can find it difficult navigating this UI. But this also gives access to customer support backed by Urban Company's core business ie., service booking.

Purification technology

The Native M3 Pro uses a 10-stage purification system combining RO, UV, copper, alkaline treatment and the DualFlow Mineraliser. Urban Company says the M3 series uses 100% RO processing, along with larger filters, Smart Rinse and the RO Life Booster system.

Urban Company says the system can purify input water up to 2,000 ppm TDS, which means it can handle difficult water conditions.

In my testing, the purifier reduced municipal water from around 900 ppm TDS to roughly 100 ppm. The resulting water tasted clean and neutral.

The storage tank filled from empty to full in about 30 minutes in my setup. At 10:18am, the purifier was switched on with an empty tank. By 10:48am, it had reached full capacity.

I also collected around 3.5 litres of reject water during that cycle. Against roughly 6 litres of purified water, that works out to about 63% recovery. That is even slightly above Urban Company's stated up to 60% recovery figure.

There is a built-in battery as well, so the purifier can continue dispensing the stored water during a power cut. That is pretty useful in India, particularly in areas where short power interruptions are quite common.

Should you buy the UC Native M3 Pro?

Yes, the Urban Company Native M3 Pro is worth buying if your home needs RO purification and you want to avoid the recurring hassle of filter replacements and servicing. For the asking price of Rs 24,999, it is expensive, but the three-year warranty, stainless steel tank and useful water quality monitoring make a strong case for the price.

I had a different water purifier installed at my place before this. The Native M3 Pro is far better to live with, and my family prefers it too. Being able to check input and output TDS, track water consumption and monitor filter health gives you more control over an appliance that runs every day. The water tasted clean in my testing, and the companion app offers a rather practical and informative interface.

The three-year unconditional warranty is another reason you might consider it. Urban Company promises to cover the filters, membrane and other components during this period. Afterwards, you'll have to pay Rs 7,000 to extend that coverage for another three years. This appears to be an attractive option for anyone looking to keep long-term maintenance costs predictable.

There are no major drawbacks. Compared to some of its competitors, even the lower priced ones, the Native purifier's 6-litre tank is small. Also, the Urban Company app can seem overwhelming to some.

Still, for households that genuinely need RO, the M3 Pro is a strong choice for its combination of purification, monitoring and predictable maintenance.
