B-SCHOOLS MUST TEACH THE ART OF JUDGEMENT

AS AI MAKES TRADITIONAL COURSEWORK INCREASINGLY REDUNDANT, BUSINESS SCHOOLS MUST REDESIGN CURRICULA TO PLACE A PREMIUM ON HUMAN JUDGEMENT

EVERY BUSINESS SCHOOL STUDENT IN INDIA NOW HAS AI CHATBOTS THAT CAN ANALYSE A CASE study and write a competent term paper in minutes. With one prompt, AI can draft a marketing plan, build a valuation model, write a strategy memo or solve a quantitative decision problem. A polished answer no longer proves that a student has learned anything.

What should we teach when AI handles the analysis, and how do we teach students to work with AI as a colleague without handing their thinking over to it? When answers are free, the scarce skill is judgement. Students must learn to frame problems, decide with incomplete information, weigh trade-offs among profit, people and ethics, and own the consequences of their decisions.

Every course should be redesigned with AI at its core. Marketing students should run campaigns with AI agents, finance students should audit a valuation that AI built, and operations students should redesign a workflow in which software agents do half the work.

Case teaching needs two contrasting approaches. The first makes the work AI-proof. Students read and analyse a short in-class case without AI and write their answers by hand. The second approach gives students full access to AI and requires them to question and improve what it produces.

ANSWERS ARE EASY TO ACCESS TODAY. STUDENTS MUST LEARN TO DECIDE WITH INCOMPLETE INFORMATION AND OWN THE CONSEQUENCES OF DECISIONS

Most faculty design a syllabus, refine it for a few years and then teach it for a decade. AI changes every management discipline faster than that cycle allows. Faculty in Indian B-schools spend their time on grading and administration for large sections. AI can take on most of that work. At Pedagogix.ai, an AI-native pedagogy company I co-founded, we have built platforms to design courses, run them and run simulations like placing students in a fictional quick commerce company in Hyderabad.

Indian faculty carry heavy teaching loads, and promotion rewards publications more than teaching innovation. Deans must give faculty time, training and credit for redesigning courses. The tools and knowledge that graduates take out of a B-school will age quickly. What will endure is the ability to learn. ■
