

FUNCTIONAL FOCUS

4 STRENGTH TRAINING FOR LONGEVITY

Muscle is moving beyond aesthetics to be understood as the metabolic armour that supports strength, function, and independence as we age. This new selling point is wonderfully unglamorous: Strength makes everyday life easier. Like opening a heavy door, carrying a suitcase up a few flights of stairs, or getting up from the floor. Lifting weights helps preserve muscle strength and physical function, which becomes especially important as we get older. It also supports bone health and glucose regulation.

HEART HEALTH

6 CARDIOVASCULAR FOCUS

The conversation is moving beyond simply burning calories towards building aerobic capacity, improving mitochondrial efficiency, and maintaining cardiovascular health. After years of HIIT and all-out intensity, slower cardio is back. Zone 2—broadly, sustained low-to-moderate aerobic exercise—has become a popular training concept among athletes and fitness enthusiasts. The point is not to abandon hard training but to recognise that a strong engine needs more than occasional redlining.

REST & RECOUP

5 RECOVERY AS TRAINING

Fitness culture has long celebrated the workout and ignored what follows. That is changing. Sleep, breathwork, mobility, time in the sauna, cold exposure, and nervous-system recovery are becoming part of the actual fitness programme, not what you do only when you are tired. The booming recovery market—from saunas and cold plunges to compression boots— is the more fashionable expression of this evolution. The basics remain harder to beat.
