

another device into the market but to operate behind all the existing ones. It learns how a household goes about its daily routine and quietly coordinates features like the temperature, lights, blinds, and the sound system into one, consistent response that doesn't require individual handling.

To articulate further, a "good morning" isn't processed as a single command—it's a scene that unfolds from dozens of small decisions that the system has already made on your behalf. And this scene isn't the same for every member of the household either—the systems gradually work out who's making the request. So, "movie time" for a teenager and a grandparent would have entirely different lighting, volume, and seating warmth in the same room tailored to the individual. Systems like Savant, which is installed in the homes of some of India's most eminent families, facilitate such quiet coordination, taking luxury automation beyond response into intuition.

"Savant's natural-language intelligence—accessible through voice experiences in more than 56 languages—can interpret intent and orchestrate lighting, climate, music, and entertainment around weather, occupancy, personal routines, and the celestial clock," explains Ashish Tijare, CEO, Intelligible Tech Solutions Private Limited, the authorised national distributor for Savant in India. "The result is advisory ambience: a living environment that not only responds to a request, but anticipates whether the moment calls for focus, restoration, celebration, or cinematic immersion."

It's inarguably one of the most expressive elements of the intelligence we speak of. The Philips Hue Light Theatre arrangement, for one, transforms an evening spent watching television into a dramatic cinematic experience by synchronising the ambient colours and brightness with what is on the screen in real time.

Then there's the Signify NatureConnect Skylight. In rooms without windows that don't receive sunlight, it can simulate a convincing blue sky and a changing daylight cycle so effectively that the eye ceases to question it. This takes comfort from a single ideal setting to light that matches the time of day.

The world of wellness, too, has gradually moved from a reactive to a predictive approach. For instance, the Google Nest Learning Thermostat employs AI to analyse the rhythms of a household—when people wake up, when they leave the house, and when a room is empty—and makes adjustments accordingly. This, in turn, helps save up to 30 per cent energy by neither heating nor cooling the house when no one is around.

Full-home systems go a step further: They bring the house into an energy-efficient state while everyone is away and then restore each room to a comfortable temperature before they usually return. This kind of energy intelligence doesn't draw attention to itself but only lowers the bill.

Security has undergone a similar change, transitioning from vigilant to invisible. AI-equipped cameras and video doorbells now identify a known face and allow them in without sounding an alarm, reserving their attention for unknown visitors.

Smart functions in kitchen appliances bring us AI-enabled refrigerators that don't simply store food. They use cameras to track what's inside—right down to a carton nearing its expiry date—and suggest what to cook with them, sending commands on temperature and timing straight to a connected oven so the meal can prepare itself.

From the automatic curtains and smart assistants listening in each room to the energy systems seamlessly adjusting themselves, an AI-Q home isn't merely a display of gadgets but a subtle redefinition of luxury—one that has moved from owning things to enjoying a home that considers your needs before you can think about them.

I didn't set out to live in the future with the way I set up my home; I simply stopped wanting to do things a house could handle on its own. And somewhere along the way, an ordinary Tuesday started to resemble science fiction, still finding new ways to improve. ■

Clockwise from top: AI home orchestration coordinates smart home systems like lighting, climate, security, and audio into one unifying system; a variant of the Dreame robot
