Ten Technologies Group's results illustrate how digital adoption can improve the economics of concierge services. The UK-based concierge and customer-experience company says net revenue for the year ended August 31, 2026, is expected to rise 6% to about £69.7 million. The number of active members grew 23% to 461,000, which the company attributed to greater adoption of digital platforms and channels. The first-half figures showed operating expenses per member request down 9% and net revenue per employee up 11%. Chief executive Alex Cheatle said the digital service was enabling lifestyle managers "to serve more members efficiently".

Dipali Sikand, Founder of Les Concierges and Club Concierge, describes a similar productivity gain from their AI assistant Mira, named after her mother. Mira briefs requests, recalls preferences, routes work and drafts replies. "One lifestyle manager now looks after twice as many members than a few years ago," Sikand says.

AI can help a lifestyle manager work faster and with better information. But knowledge built over years on the ground still has to be earned. Whether members will accept AI as the service itself is a separate question.

**"AI understands what you ask for; a great concierge understands what you mean. AI can suggest ideas for a birthday. But there are situations where value lies in knowing why a member is asking for something"**

## AI-N'T QUITE THERE

RedBeryl's experience offers an early test. Founded in 2023 by Manoj Adlakha, RedBeryl launched a customer-facing AI concierge in July 2025 but later shifted AI to the backend. "The biggest learning has been that our members value a personal relationship more than a new interface," says Adlakha. "The client-facing AI experience did not attract the appetite we initially expected."

Members now deal with a dedicated luxury lifestyle manager, while AI works in the background. It organises the brief, recalls what a member has shared—from family context and dietary needs to seating preferences—and prepares recommendations. A human checks whether a plan suits the member and can be delivered before anything is confirmed.

The experiment exposed limits as well as uses. "End-to-end itinerary creation proved among the hardest," says Adlakha. A plan can look convincing on screen and still miss a family's pace, preferences, or practical needs. By contrast, connecting a member's previous trips, favourite restaurants, and family tastes has helped the team build context for future recommendations.

At Les Concierges and Club Concierge, Sikand says, Mira listens to the way people ask for help: in fragments, voice notes, and forwarded screenshots. "She turns that into a clean brief: who, what, when, for how many, and what matters to this member," says Sikand. Mira also keeps every conversation on one record, whether it arrived by email, WhatsApp, or a phone call. "We do not let her confirm anything," says Sikand.

Other firms are also using automation, though in different ways. Aspire Lifestyles uses it for request routing, information gathering, workflow management, and some repetitive or transactional tasks, according to Sumit Prakash, Managing Director for India, West Asia, and Africa. "Technology has helped remove some repetitive administrative work," he says, "allowing lifestyle managers to focus more on high-value interactions and requests that require judgement, creativity, and relationship management."

Concierge work is not limited to travel, access, and exclusive experiences. For some affluent households, it also involves coordinating the everyday tasks that keep a home running. Technology can help by recording requests, tracking reminders, and keeping routine operations organised.

Pinch, which manages household operations—including errands, staff, vendors and mainte-
