

Diamonds in Stereo

FEW AUDIO ACCESSORIES venture into the territory of high jewellery quite like Loewe's Ice Diamond headphones, created in collaboration with Jacob & Co. Their defining feature is a spectacular arrangement of 456 round brilliant-cut diamonds, totalling 12.47 carats. The diamonds catch the light from every angle, their brilliance amplified by the cool sheen of white gold. The result is an arresting marriage of precious materials and sculptural design, where the ear cups become a canvas for the meticulous craft of fine jewellery. The headphones retain Loewe's focus on listening quality, with adaptive noise cancellation, personalised sound, and up to 65 hours of playback.

Diamonds and Sound

KHARMA'S ENIGMA VEYRON 1D loudspeaker puts diamonds to work in a way few luxury objects can claim. At its centre is the diamond Lotus flower featuring an eight-tweeter arrangement comprising four 25mm and four 50mm diamond tweeters. Kharma describes it as the largest diamond cone surface ever made for dynamic loudspeakers. The diamonds are not ornamental additions but integral to the speaker's acoustic design, engineered to deliver higher resolution and a richer spectrum of tonal variations.

The craftsmanship extends to the cabinet, constructed from 100 mm-thick Bulletwood panels machined using five-axis CNC technology. The speaker's stand incorporates Carborundum balls placed on diamonds, creating minimal contact with the surrounding surface to reduce unwanted resonances. The combination of materials and engineering is designed to preserve the purity of sound while giving the system a distinctive physical presence.

Finished in high-gloss black with gold trimming and Macassar veneer as standard, it brings together diamond technology, precision engineering, and high-end audio.
