SIXTY-TWO WORLDS FOR THE THIRD MILLENNIUM: KNOWN MOONS OF THE PLANETS (AND ONE ASTEROID)—LISTED IN ORDER OF DISTANCE FROM THEIR PLANET

EARTH, 1	MARS, 2	IDA, 1	JUPITER, 16	SATURN, 18	URANUS, 15	NEPTUNE, 8	PLUTO, 1
Moon	Phobos	Dactyl	Metis	Pan	Cordelia	Naiad	Charon
	Deimos		Adrastea	Atlas	Ophelia	Thalassa	
			Amalthea	Prometheus	Bianca	Despina	
			Thebe	Pandora	Cressida	Galatea	
			Io	Epimetheus	Desdemona	Larissa	
			Europa	Janus	Juliet	Proteus	
			Ganymede	Mimas	Portia	Triton	
			Callisto	Enceladus	Rosalind	Nereid	
			Leda	Tethys	Belinda		
			Himalia	Telesto	Puck		
			Lysithea	Calypso	Miranda		
			Elara	Dione	Ariel		
			Ananke	Helene	Umbriel		
			Carme	Rhea	Titania		
			Pasiphae	Titan	Oberon		
			Sinope	Hyperion			
				Iapetus			
				Phoebe			

Mars is a different story. It is a smaller world than Earth, with a much thinner atmosphere. The pressure at the surface of Mars is, in fact, about the same as the altitude in the Earth's stratosphere to which Simons rose. So we might expect the Martian sky to be black or purple-black. The first color picture from the surface of Mars was obtained in July 1976 by the American *Viking 1* lander—the first spacecraft to touch down successfully on the surface of the Red Planet. The digital data were dutifully radioed from Mars back to Earth, and the color picture assembled by computer. To the surprise of all the scientists and nobody else, that first image, released to the press, showed the Martian sky to be a comfortable, homey blue—impossible for a planet with so insubstantial an atmosphere. Something had gone wrong.
