*A value that nicely approximates modern estimates of the number of planets orbiting stars in the Milky Way Galaxy.

*Most of it may be in “nonbaryonic” matter, not made of our familiar protons and neutrons, and not anti-matter either. Over 90 percent of the mass of the Universe seems to be in this dark, quintessential, deeply mysterious stuff wholly unknown on Earth. Perhaps we will one day not only understand it, but also find a use for it.
