efforts demonstrated the organization's resilience and its ability to navigate around uncooperative member states.

The WHO's approach highlights a broader phenomenon: IOs' sidelining of intransigent leaders by circumventing their resistance and sourcing essential resources elsewhere. The proliferation of information-gathering technologies and overlapping institutional mandates has created a network of actors capable of filling these gaps. When one state or leader withholds cooperation, IOs increasingly turn to alternative sources, showcasing their adaptability.

The withholding of information from IOs is not unique to the WHO. Leaders have resisted sharing climate data with the United Nations,[1] suppressed development-related statistics required by the IMF,[2] and obstructed nuclear oversight by the IAEA (Carnegie and Carson 2020). As detailed in the previous chapters, populists have also withheld and distorted scientific data intended for the World Bank and manipulated greenhouse gas emissions data submitted to the UNFCCC. These actions reflect a broader trend of populists' undermining of IOs through their anti-elite and sovereignty-focused ideologies.

Such behavior threatens global cooperative efforts, raising the question of whether IOs can adapt to overcome these challenges. This chapter explores these dynamics, focusing on the strategies IOs employ to navigate the problem of information suppression.

IOs often opt to collect the needed information from alternative sources when populists refuse to provide it. Advances in technology and the proliferation of actors with relevant data make this strategy increasingly feasible. Whether pooling resources with other IOs, collaborating with NGOs, or leveraging private sector expertise, IOs have found innovative ways to bypass uncooperative states.

For instance, security-focused IOs like the African Union, European Union, and United Nations have increasingly pooled resources to compensate for funding cuts by populist-led states. Similarly, development-focused institutions like the World Bank, African Development Bank, and Asian Development Bank have co-financed projects to share financial and informational risks. Election monitors, too, have coordinated their efforts to ensure comprehensive oversight in the face of populist resistance.
