

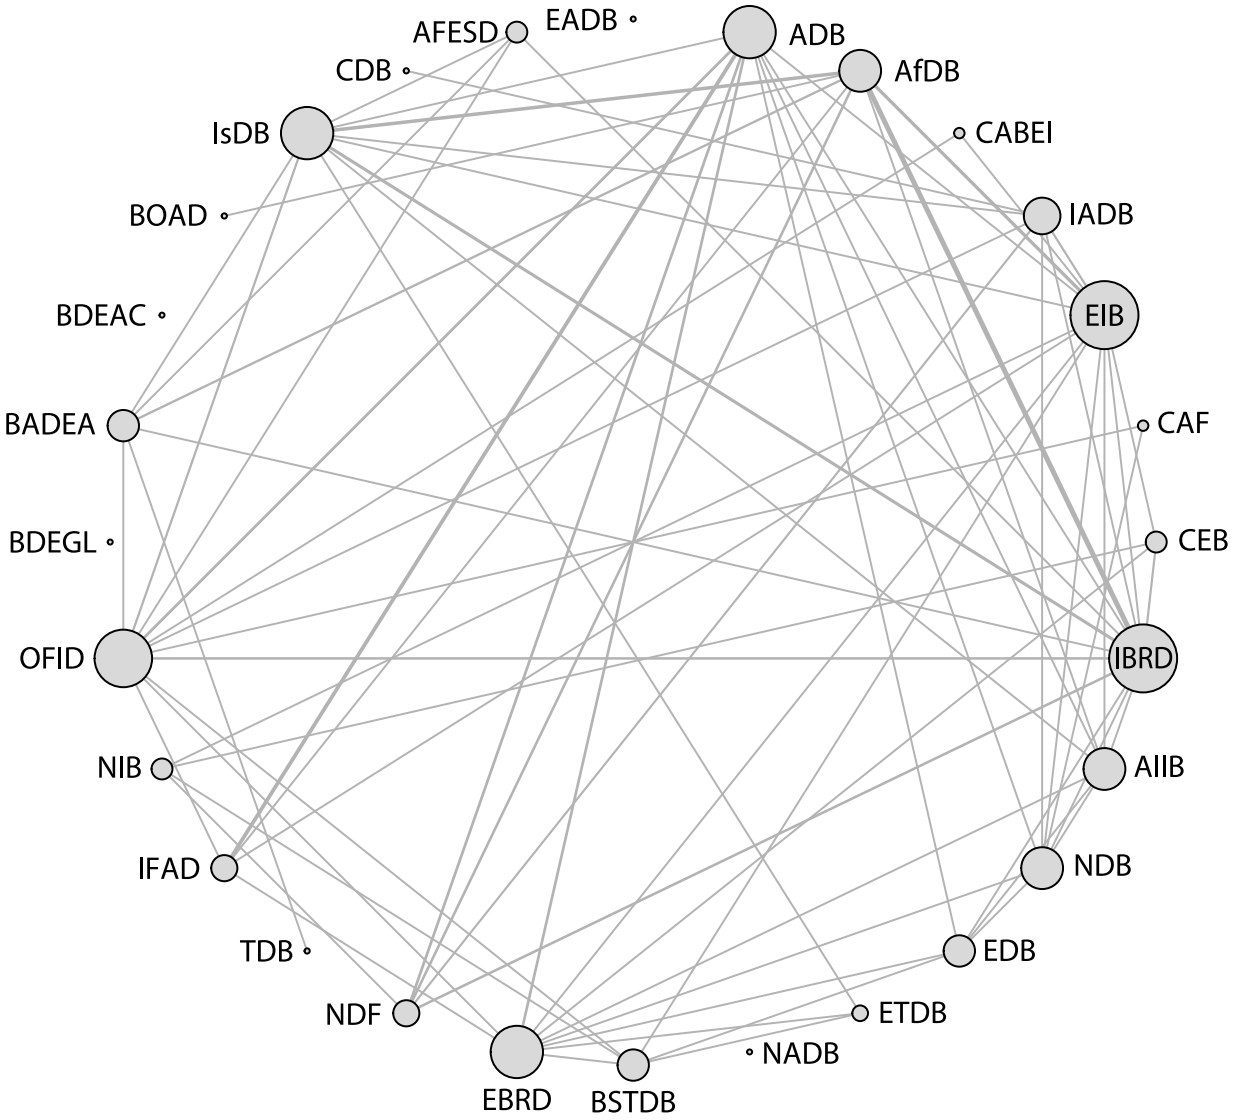

FIGURE 4.1. Average levels of information sharing among development IOs. The size of the circles is increasing in the information sharing of the IO in question. Thicker lines connecting IOs indicates more information sharing on average. Averages are calculated by taking the total number of agreements signed by a given dyad and dividing it by the total number of years the IOs have both operated and thus could have shared information.

The nature of information shared through these agreements varies considerably, ranging from economic statistics to technical expertise. For example, some agreements focus on co-financing projects and mitigating associated risks, while others emphasize exchanging managerial best practices or strategies for delivering development assistance.
