Note: Model type is negative binomial. Dyad and year-fixed effects are included. Robust standard errors are clustered at the dyad-level.
***p <.01; **p <.05; *p <.1

By expanding their informational networks through formal agreements, IOs not only mitigate the impact of populist-driven information withholding but also enhance their resilience. These partnerships enable organizations to pool resources, share expertise, and maintain their operational effectiveness, even in the face of significant political and institutional challenges. As such, information sharing emerges as a critical strategy for safeguarding the functionality and credibility of global governance institutions.

4.4 Illustrative Example: IO Information Dynamics Under Trump

This section traces the impact of populist leadership on the dynamics of information sharing among IOs, using the election of Donald Trump during his first term as a case study. Trump's presidency provides a valuable lens for examining how populist leadership influences IO behavior, particularly within US-led institutions. This case is especially significant because of the geopolitical weight of the United States and the availability of detailed data on information sharing and suppression.

Our theory predicts that US-led IOs would respond to increased information suppression and distortion under Trump by intensifying their
