

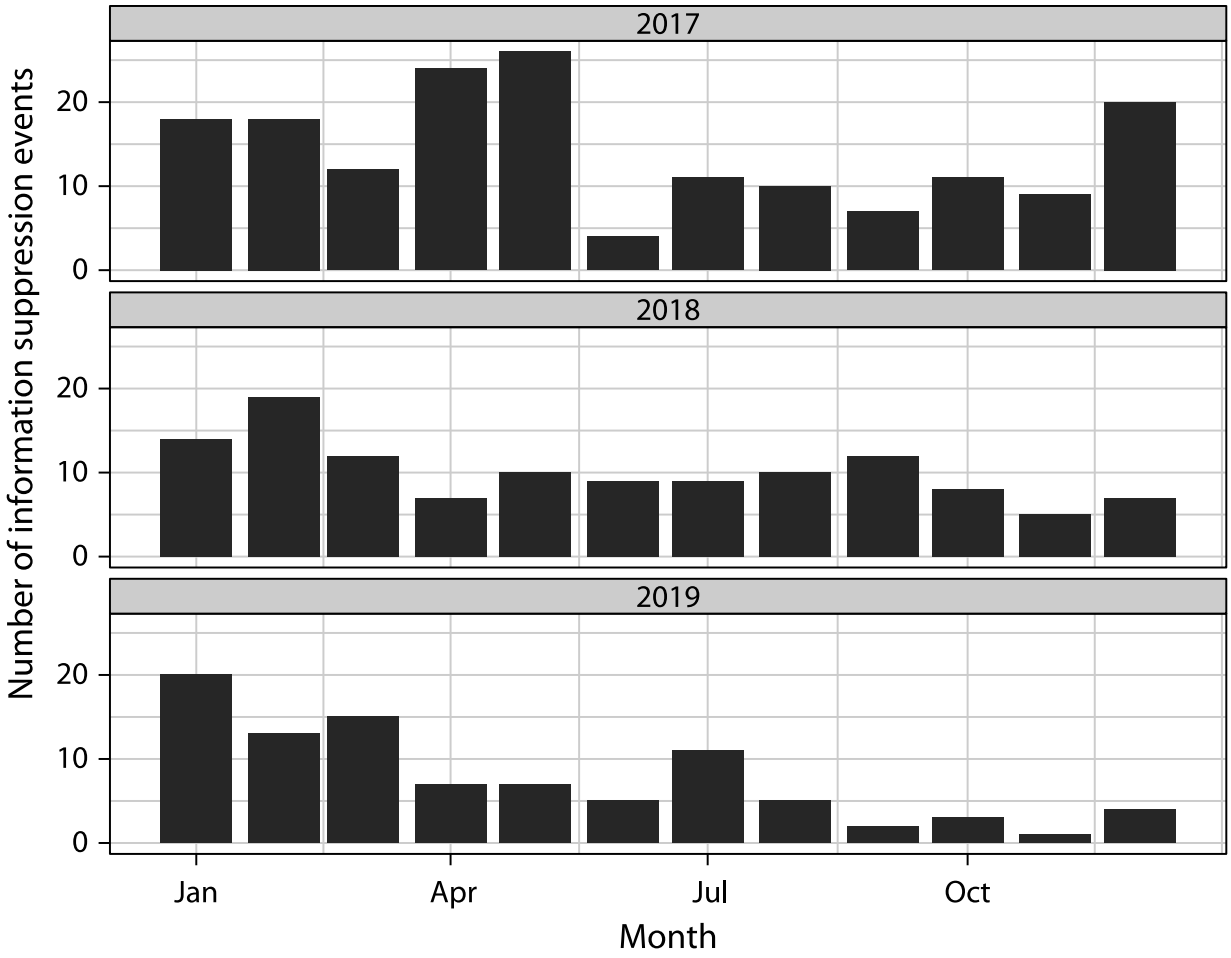

FIGURE 4.6. US information suppression, 2017–2019. Data come from Silencing Science Tracker.

These suppression tactics included blocking US scientists from contributing to international reports, cutting funding for NASA's Carbon Monitoring System (essential for UN deforestation programs), and injecting political bias into environmental assessments.[19] For example, the US Bureau of Land Management published a report downplaying climate risks in Arctic drilling proposals. Similarly, the Trump administration's budget proposals targeted research agencies central to IO information flows, such as the EPA, NIH, and NSF, with substantial funding reductions.[20]
