

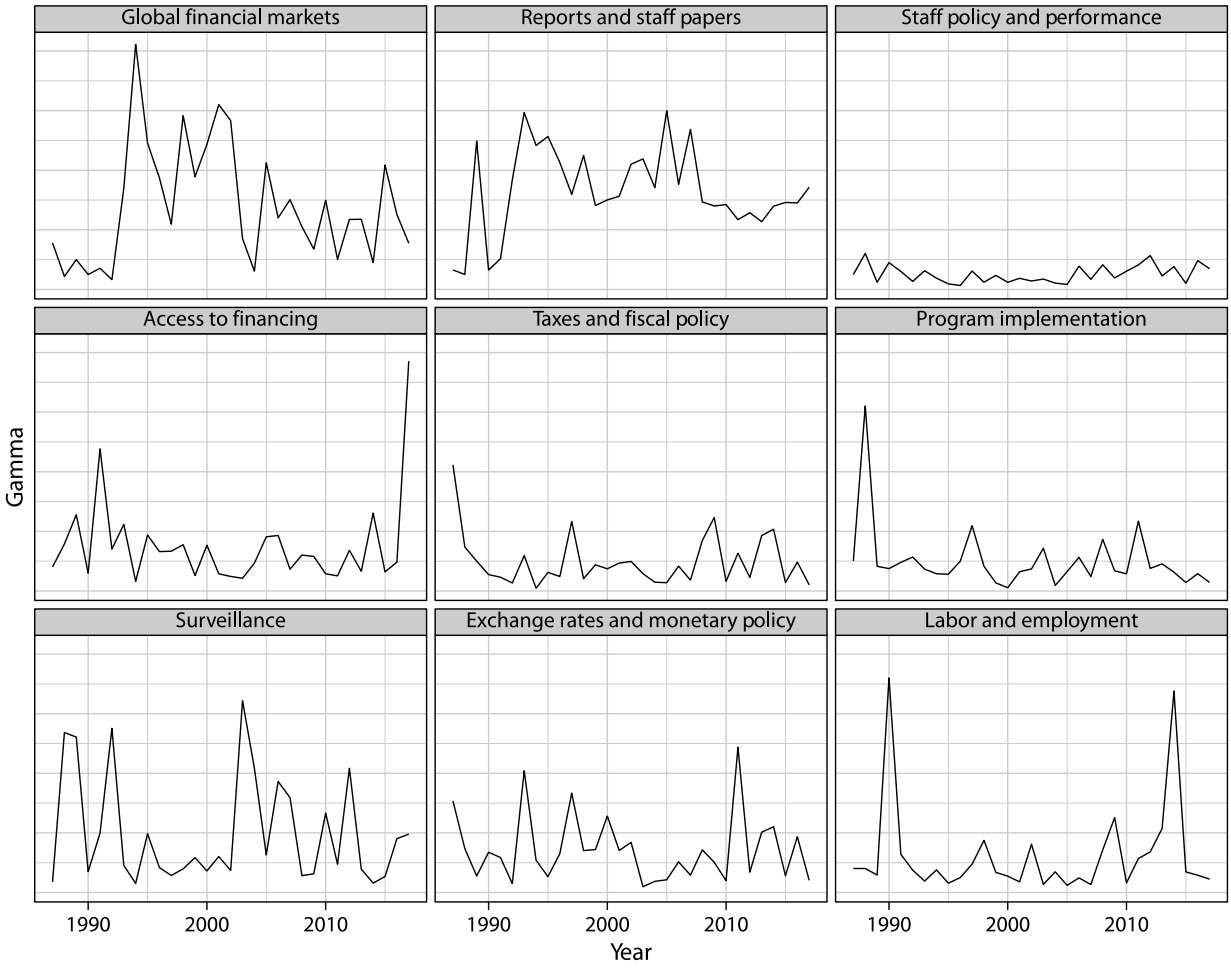

FIGURE 6.2. Topics in Grays.

To systematically assess the relationship between populism and private IMF participation, we begin with a parsimonious baseline model and progressively add controls for political, economic, and institutional factors—many of which were present in analyses in the previous chapters. These include Polity2 democracy scores, right-wing leadership, UN voting alignment with the United States, US aid receipts, UNSC membership, an array of economic indicators, IMF program participation, and vote-power asymmetry, which measures the gap between a country's economic power and its voting influence at the IMF (Pratt 2021). We again address missing covariate data through multiple imputation.

The results, presented in table 6.2, strongly support our theoretical expectations. Across all models, countries with populist leaders exhibit significantly higher levels of private participation at the IMF. The effect is
