respectively. The populist-style treatment significantly increased support for the IO, particularly among respondents who support populist candidates (operationalized with a binary measure of whether a respondent reported voting for President Trump in the 2020 election). The elite-style treatment did not boost support and, in some cases, slightly reduced perceived fairness and approval, likely because of its focus on technocratic expertise.

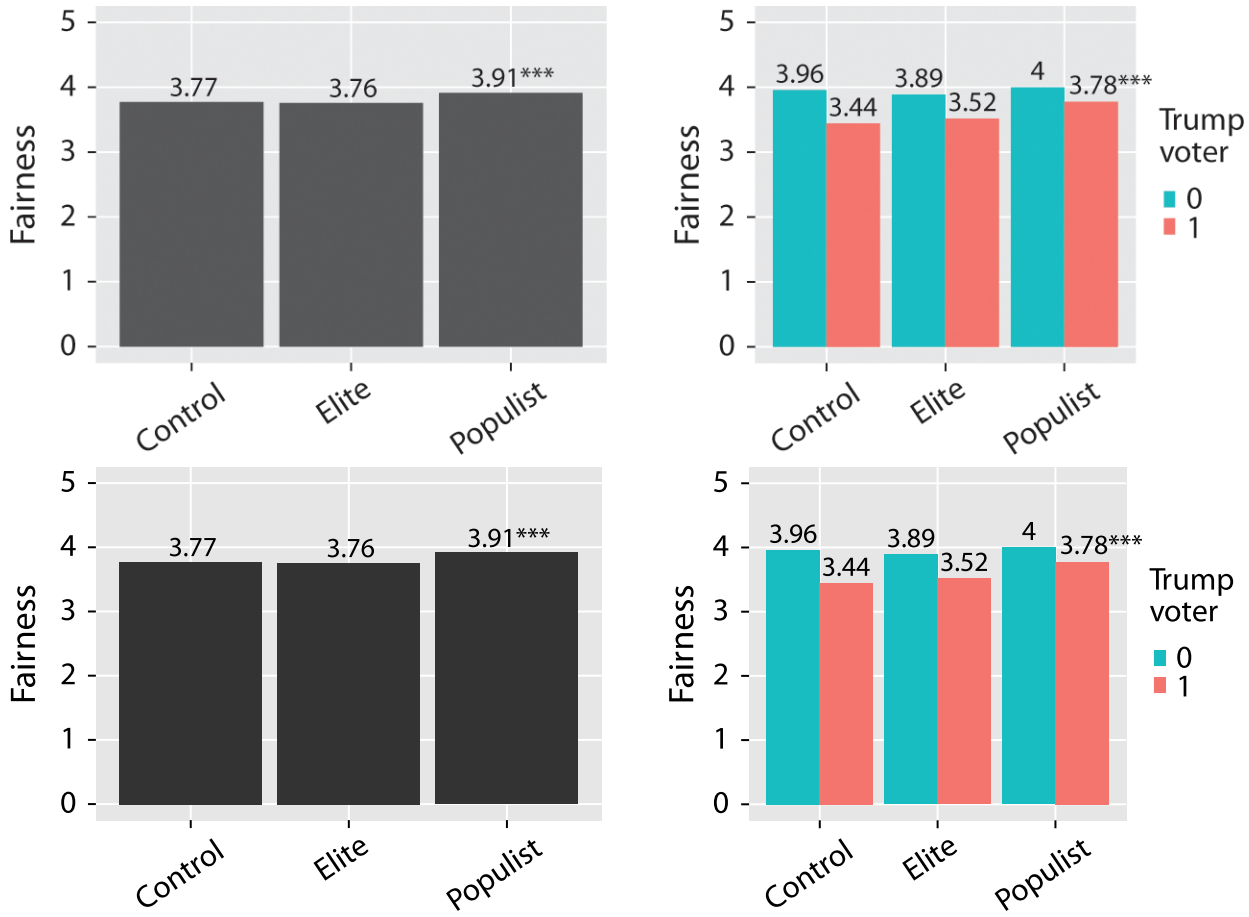

FIGURE 7.4. Perceived fairness of IDF by treatment condition. *Left*: Pooled sample. *Right*: Sample broken out by Trump voter. The plots denote average perceived fairness by treatment condition and 2020 presidential vote choice. Statistical significance is denoted with respect to the control condition within a given group as determined by a one-tailed t-test. ***p <.01; **p <.05; *p <.1

To account for demographic variables, we modeled the data using a regression framework (table 7.4). In the pooled sample, populist-style
