For instance, the WTO recently hired personnel solely dedicated to outreach efforts, illustrating a broader trend among IOs.[14] Centralized communications help IOs project coherent and effective messages, particularly when countering negative populist narratives. We thus hypothesize that as the number of populist-led member states increases, IOs will intensify their communication centralization to ensure consistent and effective messaging across their membership and enable them to more effectively leverage public-facing communication outlets like social media.

To assess whether this is the case, we use data from Ecker-Ehrhardt (2018b) on the centralization of IOs' communication apparatuses. This measure evaluates the extent to which an IO's communication functions are codified (formally outlined in organizational rules) and departmentalized (supported by dedicated organizational capacities). The centralization index, which ranges from 0 to 12, aggregates information from IO documents across 48 prominent IOs spanning sectors such as security, development, and regional integration.
