agency announced plans to expand its donor base from 78 state contributors to 110, further safeguarding its financial independence.[80]

To appease the Trump administration, the UNFPA also sought to reframe its messaging, minimizing direct references to abortion and instead emphasizing broader goals like “sexual and reproductive health.” This rhetorical shift was designed not only to placate Trump but also to appeal to conservative domestic audiences in member states (Hirschmann 2021). The organization expanded its communications and public relations efforts, hiring specialists to highlight the humanitarian nature of its work. These efforts increased public awareness and support within the United States, leading to individual and corporate donations that helped sustain the agency during this challenging period (Hirschmann 2021).

Behind the scenes, the UNFPA engaged in discreet lobbying efforts with the Trump administration, presenting itself as a humanitarian organization focused on critical issues like maternal health, gender equality, and emergency aid. By recasting its operations in this light, the agency aimed to soften its image and maintain some level of cooperation with US officials (Hirschmann 2021).

Ultimately, the UNFPA survived Trump’s first term by securing alternative funding streams and navigating political headwinds until President Joe Biden restored US support. However, the agency continues to face challenges from far-right populist movements in the United States and abroad. Persistent opposition complicates long-term planning and threatens the stability of its programs. In Congress, for instance, some lawmakers have introduced bills to block federal funding for the UNFPA, underscoring the precariousness of its future.[81] Despite these obstacles, the UNFPA has demonstrated resilience, adapting to political adversity while striving to fulfill its global mandate.

8.9 Paris Agreement and Trump

The Paris Agreement, adopted in 2015 at the 21st Conference of the Parties to the UN Framework Convention on Climate Change, stands as a landmark treaty aimed at curbing global emissions and slowing climate change. Signed by 196 countries, including all major emitters except Iran, the agreement requires each participant to set their own nationally determined
