by leveraging a long-negotiated trade deal with MERCOSUR, tying the agreement to Brazil's continued participation in the Paris framework.[95] The proposed deal, which offered significant economic benefits for Brazil, created pressure for Bolsonaro to remain in the climate pact, as abandoning it could alienate other MERCOSUR members and disrupt Brazil's economic aspirations. Similarly, the Biden administration signaled that Brazil's disregard for climate action would hinder any efforts to deepen bilateral relations, adding further diplomatic pressure.[96]

These tactics politicized Brazil's Paris membership and mobilized domestic and international stakeholders to counter Bolsonaro's narrative. In Brazil, where climate change is broadly recognized as a serious issue, civil society groups, environmental advocates, and international partners capitalized on public opinion to challenge Bolsonaro's stance. Data from the World Values Survey revealed that 90 percent of Brazilians view climate change as a significant concern, and 60 percent prioritize environmental protection over economic growth.[97] Leveraging this public sentiment, activists and international actors kept climate issues at the forefront of political discourse, rallying support for Brazil's continued engagement with the Paris Agreement.[98]

In the short term, these combined efforts succeeded in keeping Brazil within the Agreement. Bolsonaro ultimately backtracked on his threats to withdraw, preserving Brazil's formal commitments to global climate goals. However, the underlying populist opposition to environmental policies remains entrenched among segments of the Brazilian electorate, particularly those aligned with agribusiness and skeptical of indigenous rights. This persistent anti-environmentalist sentiment poses a long-term challenge to meaningful climate action in Brazil, risking continued deforestation and weakening international efforts to address the climate crisis (Rached 2022). If left unaddressed, this populist resistance may further undermine progress, perpetuating conflict over the Amazon and complicating Brazil's role in global environmental governance.

8.11 IMF and Tsipras

In 2010, Greece secured a bailout from the EU, IMF, and ECB—collectively known as the "troika"—in exchange for implementing a
