9.1.1 Preemptive Sidelining

We have shown that IOs often sideline populist leaders, seeking out information and other resources from peer IOs and nonpopulist states to increase their resilience. Here, we consider whether and how IOs might sideline populists preemptively rather than in response to resource shortfalls. We suggest that IOs can pursue sidelining strategies that diversify the suppliers of critical resources, raise the costs of disengagement, and increase institutional readiness to withstand their attacks.

DIVERSIFICATION AND REDUNDANCY

IOs can fortify their operations against populist withdrawals by embedding redundancy and flexibility into their systems, ensuring resilience in the face of disruption. One of the most effective ways to achieve this is by diversifying their funding sources as well as their providers of expertise and information. For instance, IFIs increasingly rely on co-financing arrangements with private sector actors, peer IOs, and bilateral aid agencies (Clark 2021). In this vein, UNICEF has successfully garnered support from companies like Unilever and the IKEA Foundation,[1] while the WHO has collaborated with pharmaceutical firms to expand vaccine access. Similarly, the UNDP has worked alongside tech giants like Microsoft and SAP,[2] and the World Bank has drawn on resources from the Gates Foundation.[3] These diversified funding streams provide a financial cushion, allowing IOs to build reserves that can be tapped during periods of state-level disengagement. The UN, for example, has set aside more than $1 billion to
