ensure that peacekeepers can be deployed rapidly, even when traditional funding sources falter.[4]

Strategic flexibility in operations can also enable IOs to navigate shifts in political climates. Consider Haiti's Transitional Presidential Council, which requested that its international security mission transition to a UN peacekeeping operation. This adjustment would enable the UN to draw upon its broader peacekeeping budget, mitigating the risk of funding cuts from a potentially hostile US administration under Trump.[5] By proactively leveraging such mechanisms, the UN could secure long-term commitments to critical missions before political headwinds intensify.

Collaboration among IOs and other stakeholders also strengthens resilience. As explored in chapter 4, IOs often share information to counteract the impact of populist withdrawals. For example, the WTO regularly taps into data provided by private companies to maintain its operations (Carnegie and Carson 2020). Similarly, advances in technology have further amplified IOs' ability to operate autonomously—tools such as satellite imagery and drones have enabled the UN to gather information on troop movements and warring parties directly (as opposed to relying on member states to transmit such information; Dorn 2009). NGOs, whose capabilities have similarly expanded through technological advances, also serve as valuable partners in supplying critical data (Bush and Hadden 2019). These innovations enable IOs to function as interconnected networks, capable of seamlessly accruing resources and information from within their own ecosystems or from partner organizations. In this way, threats to individual IOs are mitigated by the broader collaborative framework in which they operate.

Subnational entities like cities and states are another critical component of IOs' strategic partnerships. In large, politically diverse countries like the United States, local governments often remain committed to international cooperation, even when federal administrations withdraw. During Trump's first presidency, the UNFCCC successfully engaged with pro-environmental states like California and cities such as Los Angeles and New York to sustain progress on climate goals under the Paris Agreement. These partnerships enabled the UN to maintain dialogue and resource sharing with American officials, bypassing federal opposition.
