Shane Mahan, Physical Suit Effects Supervisor at Legacy Effects, describes the process of creating the Winter Soldier's arm from a life-cast of actor Sebastian Stan: "First, we do an exact mold of the actor's arm for the size and the dimension, and then we do a casting out of that. But we also took him to get a 3-D scan of his arm, so we had digital information as well as a hard, real-world casting to work from. We took the designs from Ryan Meinerding's design team, and then one of our digital artists here—Won-il Song—created a digital sculpture."

"I designed this to be a seamless forearm piece," Mahan continues. "And after the digital sculpture has been done, and the par has been grown and cleaned up, it matches up to a bicep piece. One o our artists, Chris Swift, is pictured testing it."
