

When Saunders and his team saw the initial shots of Iron Man's armor in action (left), they were sold.

SAUNDERS: "Walking on the sound stage during the first test, we knew it was going to work. Without any digital enhancement — just by itself — the armor was very convincing. Even without a proper movement study, we knew we'd hit the mark."

The Mark II in its final form (Page 38, left) reveals the highly refined details of the suit's rivets, its proportion, and how its joints all fit together — all elements that go to the suit's tolerance levels for moving along with the actor inside it. Of particular note are the areas on the thighs, above the codpiece and under the kneecaps, which couldn't be a part of the final practical suit design. The actor had to be able to walk in the suit, after all; in those cases, the holes were all parts of the suit that would inevitably need to be filled in with CGI.
