"So all those pieces were built onstage," Brzeski says. "Weeks and weeks of time went into building the pieces on computer and doing previses of each individual fight piece, so we could see what we had to build. Because it was very expensive, and obviously we couldn't build a whole crane. Those are huge; they don't build soundstages big enough for them! When you drive by them, they look pretty big. But when you're actually in them, they're gigantic.

"We used a lot of steel to build the crane—extended metal, railings, and this and that. John Sampson, our construction manager, built all that stuff with welders. It was a big deal. The boat deck was just a piece of a real boat deck that was comped into a huge ship. So there was a lot of work that went on between all the different departments, trying to figure out what the fight would be and what you could build to make it happen."
