generation fighter aircraft, and how Russia's government leaders are likely to respond to "potentially destabilizing events in Moscow, such as large protests and terrorist attacks".' As Paul Rosenzweig dryly pointed out on the excellent Lawfare blog, 'The Pakistani, Chinese, and Russian intelligence agencies surely appreciate the status report.'[46]

Another category of leak revealed American offensive cyber-warfare capabilities.[47] To be sure, digital weapons are controversial. But other countries have them too. Campaigning for unilateral digital disarmament is a respectable if idealistic approach. But there is no sign that the American people support it. And the issue is a long way from the purported abuse of privacy that Snowden wanted to expose. So too is the revelation that America launched 231 cyber attacks against 'top-priority targets'.

Some of the leaks include exactly the sort of thing that intelligence agencies are paid to do. Why is it scandalous or improper that Britain's GCHQ spied on foreign diplomats at a summit in London?[48] If the NSA is able to intercept the communications of a top Russian politician, surely it deserves praise (in private), not censure and exposure (in public). Providing the full list of Snowden's damaging disclosures would be tedious. But even the highlights are shocking. They include: how the NSA intercepts e-mails, phone calls, and radio transmissions of Taliban fighters in Pakistan, and that it is keeping a closer eye on the security of that country's nuclear weapons; an operation to gauge the loyalties of CIA recruits in Pakistan; e-mail intercepts regarding Iran; and global tracking of cell-phone calls to (as the *Washington Post* naively put it) 'look for unknown associates of known intelligence targets by tracking people whose movements intersect'. To the *South China Morning Post* Snowden revealed details of how the NSA hacks into computers and mobile phones in China and Hong Kong.[49]
