Embedded module combines Wi-Fi and Ethernet connectivity

Rajguru Electronics features the HLK-7688A embedded networking module

from Shenzhen Hi-Link Electronic, built around MediaTek's MT7688AN processor. It combines Wi-Fi, multiple Ethernet ports, and peripheral interfaces in a compact design, and supports Linux and OpenWrt for software customisation. The module suits IoT gateways, smart equipment and industrial control systems, helping developers add wired and wireless networking with less hardware design complexity.

A neuromorphic AI card for edge developers

BrainChip has launched the AKD1500 peripheral component interconnect

express (PCIe) development card for evaluating self-learning AI on standard computing systems. Powered by the AKD1500 Edge AI co-processor and Akida neuromorphic architecture, it offers low-power, event-based processing of streaming sensor data. Models built with existing frameworks can be tested on desktops, industrial PCs and workstations before embedded deployment, targeting industrial sensors, robotics and machine vision.

AIPU accelerates lower-power enterprise AI inference

Axelera AI has launched its Europa AI Processing Unit (AIPU) to accelerate enterprise AI inference at lower power

and cost. Available as a chip for custom boards and as PCIe cards, it supports generative AI, agentic AI, vision-language models and computer vision. It integrates with existing servers, enabling local processing for healthcare, finance, defence, and manufacturing, with greater control over sensitive data.

Edge AI comes to Bluetooth modules

Ezurio has launched its BL54LM20 Series wireless modules, bringing edge AI to compact, low-power devices. The BL54LM20B integrates an Axon NPU

for local machine-learning inference, cutting cloud dependence and latency. Based on Nordic's nRF54LM20, the modules support Bluetooth LE, Thread, Matter, and Near Field Communication (NFC). Uses include predictive maintenance, sound recognition, asset tracking, robotics, and smart buildings, with a shared footprint easing upgrades.

MANUFACTURING EQUIPMENT & MATERIALS

New tools for large-panel chip packaging

Nordson Electronics Solutions has unveiled the ASYMTEK Vantage XL dispensing system and MARCH ExoSPHERE plasma treatment system

to address manufacturing challenges in panel-level semiconductor packaging. The Vantage XL applies underfill across large panels while managing warpage and improving dispensing consistency. The ExoSPHERE prepares surfaces through uniform plasma cleaning and activation, supporting stronger adhesion and reliable bonding. Designed for advanced packaging used in AI and high-performance computing, the systems help manufacturers improve process consistency, reduce packaging defects, and scale production.

X-ray vision for food safety

Minebea Intec has introduced the Identus 80, an X-ray inspection system that detects foreign bodies and checks

quality in packaged food lines. High-resolution imaging finds dense contaminants such as metal, glass, stones, bones and dense plastics in sealed products, and supports inline fill-level and completeness checks. A teach-in function eases changeovers, and hygienic stainless-steel construction suits ready meals, salads, and desserts.
