Tata Electronics starts pilot runs at Assam semiconductor plant

Tata Electronics has begun pilot chip production at its ₹270 billion semiconductor assembly and test facility in Jagiroad, Assam, following completion of its first cleanroom. Designed for 48 million chips daily, the plant is expected to be formally inaugurated between December 2026 and January 2027. Sixteen international partnerships aim to diversify sourcing.

India launches plan for indigenous power grid semiconductors

The Ministry of Electronics and IT (MeitY), the Power Ministry and Powergrid have begun a pre-tender consultation to develop domestic silicon carbide (SiC) metal-oxide-semiconductor field-effect transistor (MOSFET) power modules for high-voltage direct-current transmission systems. The initiative covers device design, fabrication, packaging, assembly, and system integration, with field testing and an initial purchase commitment of approximately 13,000 validated modules. It aims to reduce reliance on foreign technology for critical power infrastructure.

Tamil Nadu launches semiconductor ecosystem scheme to attract chip investments

Tamil Nadu has launched a semiconductor ecosystem scheme offering additional financial incentives for investments across wafer fabrication, materials, assembly, testing, packaging, and supply chain. It supports projects approved under central semiconductor programmes and provides customised incentives for strategically important projects outside those programmes, aiming to strengthen the state's semiconductor manufacturing and advanced electronics capabilities.

Tessolve Semiconductor secures US$75 million investment from Vector Line Capital

Tessolve Semiconductor has secured US$75 million from US-based Vector Line Capital to expand semiconductor engineering capabilities, pursue acquisitions and strengthen its global presence. Its services span chip architecture, design, validation, testing, and embedded systems, including AI and high-performance computing applications. The company is in advanced discussions to close multiple acquisitions over the next two quarters.

HCLTech begins commercial operations at Bengaluru semiconductor lab

HCLTech has begun commercial operations at its $22 million Advanced Semiconductor Lab in Bengaluru, offering post-silicon engineering, advanced testing and failure analysis. The 40,000-square-foot (3716sqm) facility includes 25,000 (2323sqm) square feet of Class 10K and Class 1K cleanrooms and runs on a pay-per-use model, helping fabless startups access capital-intensive semiconductor testing infrastructure without purchasing expensive equipment.

Japanese semiconductor companies expand India presence

More than 30 Japanese companies attended SEMICON India 2026 in New Delhi, as Japan-India cooperation expands across semiconductor equipment, materials, technology and training. Around 200 representatives discussed supply chains and research and development (R&D). Companies are pursuing supplier ties, while Tokyo Electron plans a Gujarat training centre in 2027 to train semiconductor equipment engineers and upgrade their skills.

SpintronicsAI, CSIR-CEERI partner to advance indigenous GaN semiconductor technology
