Festive Smartphone Volumes to Fall 12% In India As Memory Costs Push Market Value Up 5%

Indian smartphone volumes are expected to decline 12% year-on-year during the festive sales period of October 8-November 8, 2026, while market value grows 5% as rising DRAM and NAND costs push up handset prices. The forecast reflects mounting affordability pressures and longer replacement cycles. Globally, smartphone shipments fell 20% year-on-year in Q3 2026, reaching their lowest level for any third quarter since 2012. Price-sensitive buyers face the greatest pressure, while financing, trade-ins and targeted offers are expected to influence festive sales conversions.

DRAM And NAND Flash To Account For 68% Of Major CSP CapEx In 2027

Capital expenditure across major global hyperscalers (Microsoft, Google, AWS, Meta) is projected to surge 98% YoY in 2026 and 50% in 2027. Soaring contract pricing for enterprise SSDs and server memory will push DRAM and NAND Flash to consume 68% of total cloud service provider capital expenditure (CSP CapEx) by 2027, up from 47% in 2024–2026. Memory cleanroom reallocation toward HBM (which consumes ~3× more wafer area than conventional DRAM) is sustaining price hikes across standard enterprise DDR5 and client memory.

Total CapEx Forecast for Nine CSPs

Notebook PC Shipments Face Low-Single-Digit Decline In 2027 As Rising Costs Weaken Demand

Global notebook shipments are forecast to decline by a low-single-digit percentage in 2027 as rising DRAM, CPU, and SSD costs threaten demand. Higher retail prices could extend replacement cycles and push the annual shipment decline into the high-single-digit range. For a US$900 mainstream notebook, CPU, DRAM, and SSD accounted for approximately 68% of bill of materials (BOM) costs in 3Q26.
