113. Edmund Husserl, *Vorlesungen zur Phänomenologie des inneren Zeitbewusstseins* (Halle: Niemeyer, 1928).

114. In the cited text, Husserl insists that this does not constitute a "physical phenomenon." To a naturalist, this sounds like a statement of principle: he does not *want* to see memory as a physical phenomenon because he has *decided* to use phenomenological experience as the starting point of his analysis. The study of the dynamics of neurons in our brain shows how the phenomenon manifests itself in physical terms: the present of the physical state of my brain "retains" its past state, and this is gradually more faded the farther away we are from that past. See, for example, M. Jazayeri and M. N. Shadlen, "A Neural Mechanism for Sensing and Reproducing a Time Interval," *Current Biology* 25 (2015): 2599–609.
