Einstein has given us the equations that describe how proper times develop *relative to each other*. He has shown us how to calculate the difference between two times.[7]

The single quantity "time" melts into a spiderweb of times. We do not describe how the world evolves in time: we describe how things evolve in local time, and how local times evolve *relative to each other.* The world is not like a platoon advancing at the pace of a single commander. It's a network of events affecting each other.

This is how time is depicted in Einstein's general theory of relativity. His equations do not have a single "time"; they have innumerable times. Between two events, just as between the two clocks that are separated and then brought together again, the duration is not a single one.[8] Physics does not describe how things evolve "in time" but how things evolve in their own times, and how "times" evolve relative to each other.*

Time has lost its first aspect or layer: its unity. It has a different rhythm in every different place and passes here differently from there. The things of this world interweave dances made to different rhythms. If the world is upheld by the dancing Shiva, there must be ten thousand such dancing Shivas, like the dancing figures painted by Matisse. . . .
