revolution in this Kuhnian sense, because the flat spacetime paradigm and the curved spacetime paradigm give precisely the same predictions.

11.2 A drawing by M. C. Escher. One can experience a *mind-flip* by looking at this drawing, first from one point of view (for example, with the flowing stream at the same height as the waterfall's top) and then from another (with the stream at the height of the waterfall's bottom). This mind-flip is somewhat like the one a theoretical physicist experiences when switching from the curved spacetime paradigm to the flat spacetime paradigm. [© 1961 M. C. Escher Foundation–Baarn-Holland. All rights reserved.]

When gravity is weak, the predictions of the Newtonian paradigm and Einstein's curved spacetime paradigm are almost identical, and correspondingly the two paradigms are very nearly mathematically
