predicted by Schwarzschild geometry, 132–38, 132f, 214–15
role in stellar implosion, 214, 217–19, 244, 248–55, 266, 274, 279–81, 329, 415b
role in accretion onto black hole, 139, 418b
and frequencies of gravitational waves, 367
and hoop conjecture, 266, 267f
see also Horizon
Cygnus A:
discovery of, 325f
identification of galaxy, 330–33, 332f–33f
discovery of double lobes, 333, 332f–33f
discovery of jets, 343–45
radio pictures of, 332f–33f, 344f
Cygnus X-1, 314–21, 316f

Dark star (eighteenth-century version of black hole), 122–24, 123f, 132, 133, 138, 251–53, 252f, 568N122, 568N123
Degeneracy of electrons:
concept of, 145n, 145–46, 148
relativistic vs. nonrelativistic, 150–51
in an atom, 170b
Eddington's views on, 158–60
prevents small black holes from forming, 447
see also Pressure, nonthermal, degeneracy
Degeneracy of neutrons and protons:
in an atomic nucleus, 169
in a neutron star, 170
Differential equation, 153n–54n
Differential geometry, 113–14, 471
Doppler shift, 32, 100, 101b, 103b, 304, 305f, 506–7

Einstein field equation, formulation of:
Einstein's struggle to discover, 113–17
Hilbert's discovery of, 117, 119
details of, 118b–19b, 567Nl18–19
see also General relativity
Einstein's legacy, overview of, 523–25
Einstein X-ray telescope, 314
Electric field lines:
around a charged black hole, 284, 286, 288–89, 289f, 294, 405–7, 406f
see also Magnetic field lines
Electromagnetic laws, *see* Maxwell's laws of electromagnetism
Electromagnetic radiation, spectrum of, 25f
Embedding diagrams:
introduced and explained, 126–31, 129f, 127f
as part of a "paradigm," 401
for star near critical circumference, 129f, 132f, 135
for imploding star, 213–14, 214f, 246–50, 247f
for black hole, 31f, 397, 399f
for electrically charged black hole, 288–89, 289f
for spinning black hole, 291, 291f
for binary black hole emitting gravitational waves, 357, 358f
