Firefox 157 also adds developer-facing improvements. WebGPU now supports the TRANSIENT_ATTACHMENT texture usage type, allowing developers to create memory-efficient attachments intended for use within a render pass. The feature can keep related render-pass operations in tile memory, potentially reducing VRAM traffic and avoiding additional texture memory allocation.

The release includes changes for developers and administrators. CSS support has been extended with the 'at-rule()' function for testing browser support for CSS at-rules. Firefox 157 introduces an option for administrators to control on-device speech recognition through the AIControls policy, while policy reporting now identifies individual entries that fail to apply correctly.

AMD adds patches to its AMDGPU Linux kernel driver

AMD has submitted new patches for its open source AMDGPU Linux kernel driver, including an update that adds GDDR7 as a recognised video-memory type. The change is part of a broader set of patches enabling new hardware IP blocks in the driver.

```
Add GDDR7 vram name.

The GDDR7 patch specifically adds the 'GDDR7' identifier as a video-memory name in AMDGPU. AMD's current RDNA 4 graphics cards use GDDR6, while GDDR7 is used by Nvidia's GeForce RTX 50-series desktop GPUs. The new driver change therefore provides an early software-side indication of AMD's preparation for graphics hardware using the newer memory technology.

Other patches in the same series introduce support for IH 8.0, the latest version of AMD's interrupt handler IP, and NBIF 7.10, a new version of the New Bus Interface. Several smaller changes also prepare the driver for upcoming hardware. These patches follow earlier AMDGPU work around Display Core Next 6 (DCN6) and other GFX 13.0.x components.

The changes are significant for AMD's open source Linux graphics stack because they are being prepared upstream before the associated hardware reaches the market. The latest patches establish the driver infrastructure needed to recognise and support the memory technology as future AMD graphics hardware comes along.

Nuvi turns UNO Q into AI desk companion

Nuvi is a compact desktop companion developed by Luca Di Lorenzo using the Arduino UNO Q. Standing less than 30cm tall, the robot can detect when someone approaches, respond to its name and hold conversations. Its design was inspired by Kaito, a Shiba Inu dog belonging to an Arduino employee, which helped shape Nuvi's more expressive appearance.

RoboParty's full-stack humanoid is called RP1

RoboParty has unveiled RP1, a full-stack open source humanoid robot designed to give researchers, educators and developers access to a modifiable platform for embodied AI development. The company plans to progressively open the robot's mechanical designs, actuator modules, motion-control systems, simulation environments, SDKs and training tools, extending the open approach beyond software to the wider robotics stack.

The project builds on RoboParty's earlier ROBOTO_ORIGIN (RPO) platform, whose hardware, electronics, training and deployment resources have been released publicly. Its GitHub repositories include hardware design files, ROS 2 deployment software, reinforcement-learning training workflows, URDF and MJCF models, firmware, navigation and XR teleoperation modules. The RPO aggregation repository states that its own material is generally licensed under GPLv3, while individual modules and third-party components retain their applicable licences.

For RP1, RoboParty is extending this open approach through PartyOS, its robotics research and development platform. PartyOS incorporates the UFO framework, which uses unsupervised reinforcement learning to develop low-level motion policies for behaviours such as skill transitions, disturbance recovery and fall recovery. This allows developers to work across robot control and AI training rather than treating the physical robot and software as separate systems.

RoboParty says it intends to progressively release more of RP1's hardware and software stack, allowing developers to access, modify, train and improve the platform.
