other is inside the pink circle. This pink circle is called the “Einstein ring.”

As the camera moves rightward, the images move along the yellow and red curves.

The star images outside the Einstein ring (the primary images, let’s call them) move in the way one might expect: smoothy from left to right, but deflecting away from the black hole as they move. (Can you figure out why the deflection is *away* from the hole instead of toward it?)

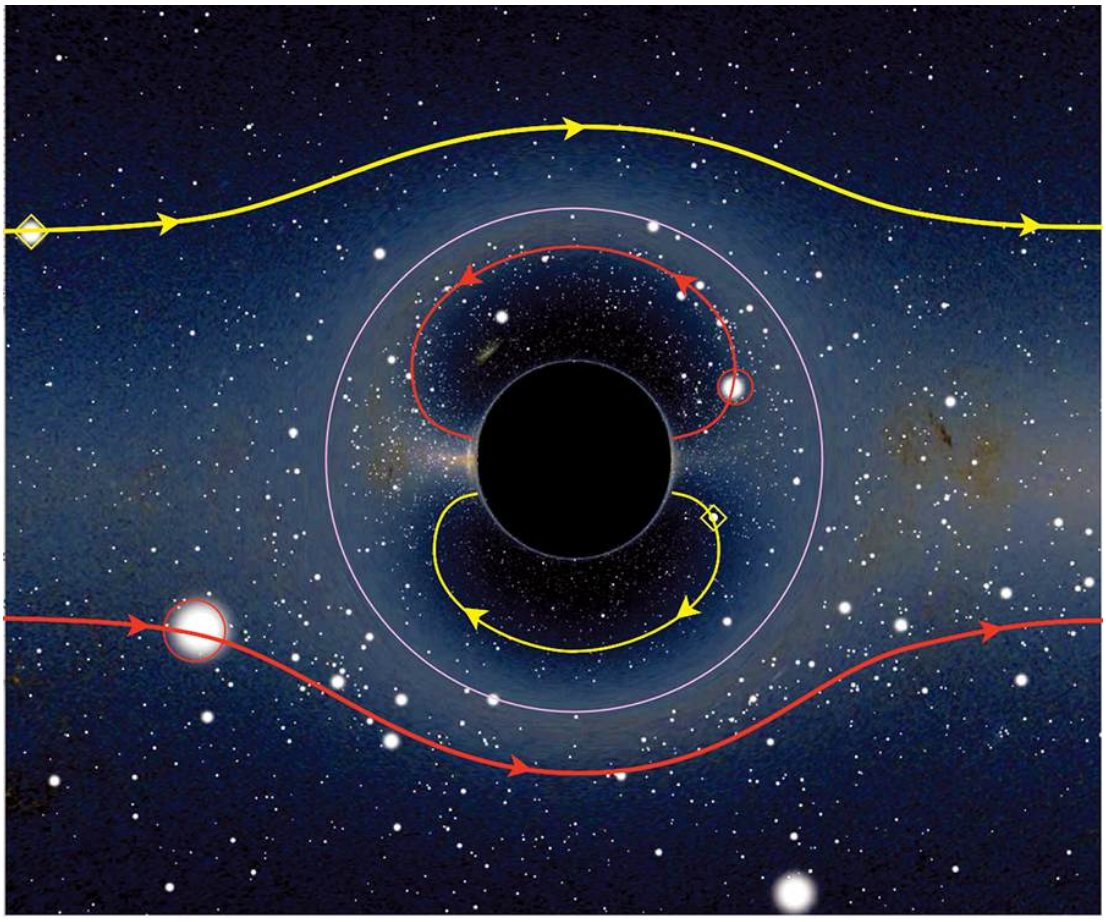

Fig. 8.4. The changing star pattern seen by the camera as it moves rightward in its orbit in Figure 8.3. *[From the simulation by Alain Riazuelo; see www2.iap.fr/users/riazuelo/interstellar .]*
