

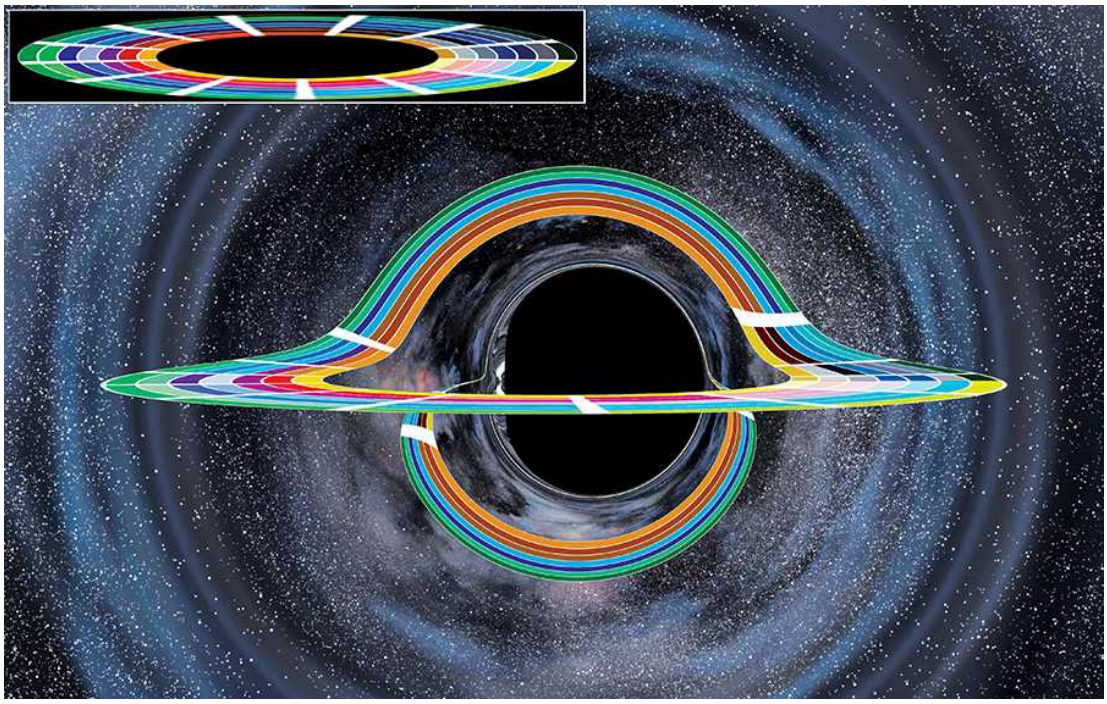

Fig. 9.7. An infinitesimally thin disk in Gargantua's equatorial plane, gravitationally lensed by Gargantua's warped space and time. Here Gargantua spins very fast. *Inset*: The disk in the absence of the black hole. *[From Eugénie von Tunzelmann's artistic team at Double Negative.]*

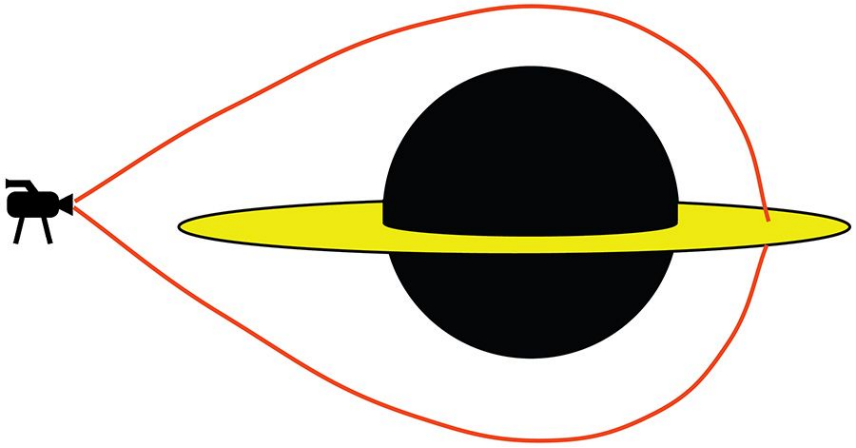

Fig. 9.8. Light rays (*red*) bring to the camera images of the back part of the accretion disk, behind Gargantua: one image above the hole's shadow, the other below the hole's shadow.

Inside these primary images, we see thin secondary images of the disk, wrapping over and under the shadow, near the shadow's edge. And
