With Gargantua's disk anemic, though gorgeously beautiful, and with no jet, is Gargantua's environment truly benign? Amelia Brand thinks so . . .

---

21 The friction arises through a complex process where moving gas winds the field up, strengthening it and thereby converting energy of motion into magnetic energy; and then the magnetic field, pointing in opposite directions in neighboring regions of space, reconnects and in the process converts magnetic energy into heat. That's the nature of friction: a conversion of motion into heat.

22 I changed the size of the hole to that of Gargantua and the size of the star to that of a red giant, and changed the time markers in Figure 9.5 accordingly.
