gravitational waves—tables based on their own calculations using Teukolsky's equations. Then they added fake observational numbers to go along with the theoretical predictions and I added pictures of Gargantua's event horizon (or rather, the edge of its shadow), pictures from simulations by the *Interstellar* visual-effects team at Double Negative. The result was Romilly's observational data set.

When Christopher Nolan filmed the scene where Romilly discusses his observations with Amelia Brand, Romilly wound up not actually showing her his data set. It was there on a table, but he didn't pick it up. However, the data set is central to my science extrapolation of *Interstellar*.

Gargantua's Resonant Vibrations

Figure 18.1 is the data set's first page. Each line of data on that page refers to a single resonant frequency at which Gargantua vibrates.
