fluctuations in the AdS layer. These fluctuations—gravitational anomalies—play a huge role in *Interstellar*. To them we now turn.

37 I discuss quantum fluctuations in Chapter 26 and bulk fields in Chapter 25.

39 Why is the magic distance, at which the inverse square law begins, 0.1 millimeter instead of, say, 1 kilometer or 1 picometer? I have chosen 0.1 millimeter quite arbitrarily. Experiments have proved that gravity obeys the inverse square law down to about 0.1 millimeter, so that is an upper limit on the magic distance. It could perfectly well be smaller.
