

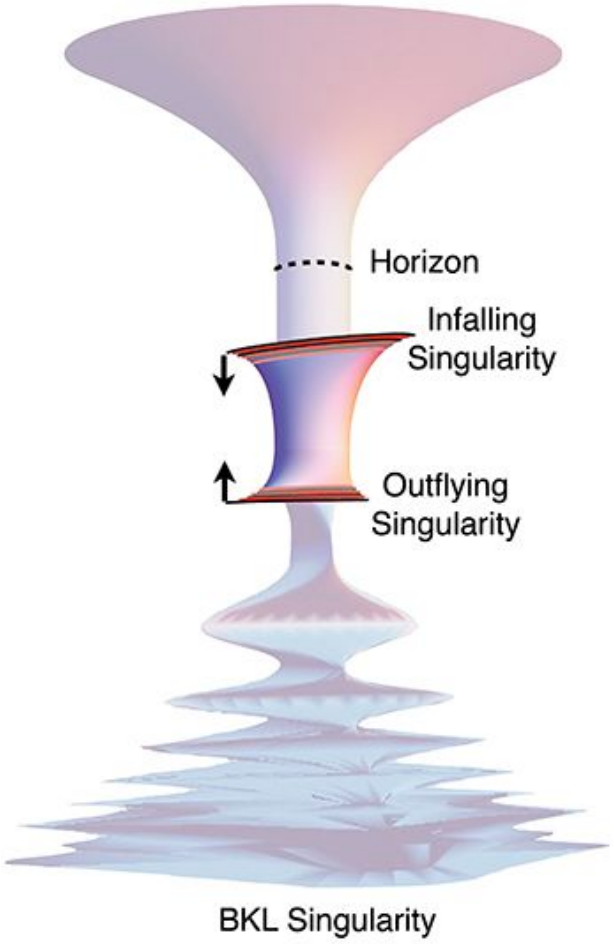

Fig. 26.13. The outflying singularity, created by back-scattered stuff that fell into the black hole before you; and the infalling singularity, created by stuff that falls in after you. You are sandwiched between them. Shown dimmed out is the exterior of the black hole and the BKL singularity, with which you can no longer have contact because they are beyond the singularities that sandwich you.

The upscattered stuff gets compressed, by the black hole's extreme slowing of time, into a thin layer rather like a sonic boom (a "shock front"). The stuff's gravity produces tidal forces that grow infinitely strong and thence become an *outflying singularity*. But as for the infalling singularity, so also for this outflying one, the tidal forces are
