

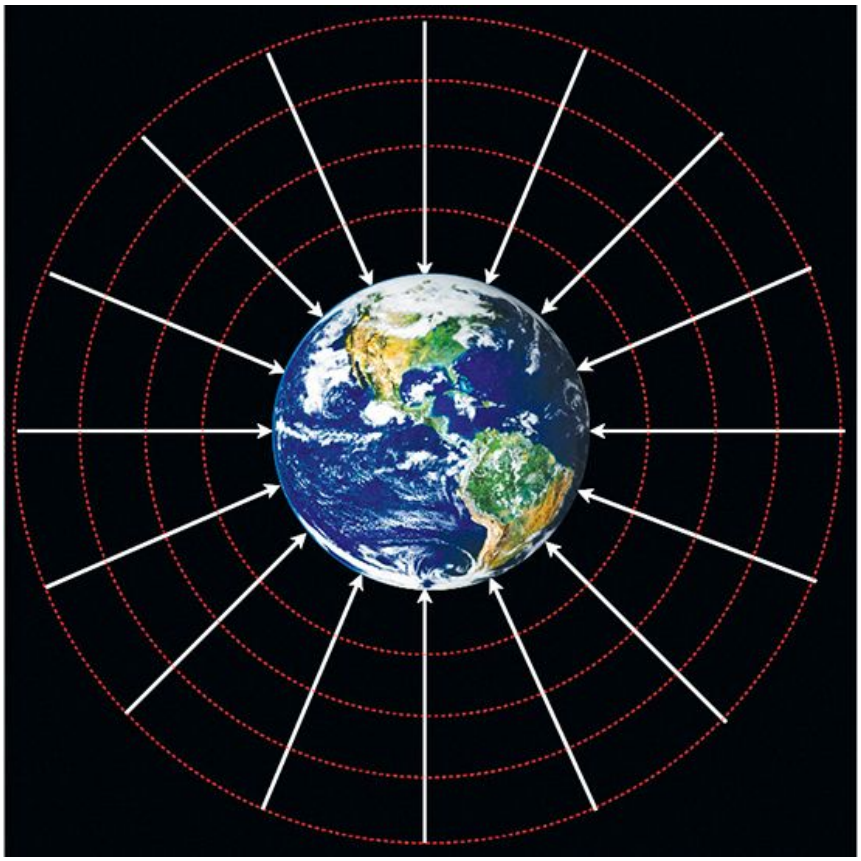

Fig. 2.11. The Earth's gravitational force lines.

---

2 Google "gravitational waves from the big bang" or "CMB polarization" to learn about this amazing March 2014 discovery. I give some details at the end of Chapter 16.

3 A light-year is the distance light travels in one year: about a hundred trillion kilometers.

4 In more technical language, its mass is a million times that of the Sun's or more, which means its gravitational pull, when you are at some fixed distance away from it, is the same as a million Suns'. In this book I use "mass" and "weight" to mean the same thing.
